# Capture studies: Mo, Ru and Pd

## Motivations:

- Accurate determination of the r-process abundances (r-process residuals) from observations
- SiC grains carry direct information on s-process efficiencies in individual AGB stars. Abundance ratios in SiC grains strongly depend on available capture cross sections data.

$$N_r = N_{\text{solar}} - N_s$$

# Capture studies: Fe, Ni, Zn, and Se

## Motivations:

- Study of the weak s-process component (nucleosynthesis up to  $A \sim 90$ )
- Contribution of massive stars (core He-burning phase) to the s-process nucleosynthesis.
- s-process efficiency due to bottleneck cross sections (Example:  $^{62}\text{Ni}$ )

## In addition:

Fe and Ni are the most important structural materials for nuclear technologies. Results of previous measurements at n\_TOF show that capture rates for light and intermediate-mass isotopes need to be revised.

- expected count rate: 1 reaction/pulse ( $\sigma=200$  mb,  $\text{Ø}=5\text{cm}$ ,  $1\mu\text{m}$  thick)

# $(n,p)$ , $(n,\alpha)$ & $(n,lcp)$ measurements

## 3. Scattering chambers with $\Delta E$ -E or $\Delta E$ - $\Delta E$ -E telescopes

Setup: in parallel with fission detectors

- ✓ production cross sections  $\sigma(E_n)$  for  $(n,xc)$
- ✓  $c = p, \alpha, d$
- ✓ differential cross sections  $d\sigma/d\Omega$ ,  $d\sigma/dE$

Measurements:

- $^{56}\text{Fe}$  and  $^{208}\text{Pb}$  (tune up experiment)
- Al, V, Cr, Zr, Th, and  $^{238}\text{U}$
- a few  $\times 10^{18}$  protons/sample in fission mode

# Neutron scattering reactions

Direct  $n + n$  scattering experiment not feasible!

Alternatively, interaction of two neutrons in the final state of a nuclear reaction. Examples of such reactions are:

Neutron incident energy 30 – 75 MeV  
in 2.5 MeV bins

Kinematic locus of the  $n + {}^2\text{H} \rightarrow n + p + n$  reaction for:

$$E_n = 50 \text{ MeV}$$

$$\Theta_n = 20^\circ, \Phi_n = 0^\circ$$

$$\Theta_p = 50^\circ, \Phi_p = 180^\circ$$
