# Overview

1. Astrophysical introduction
2. "slow neutron capture process"
  - Quasi-stellar neutron distributions
  - Stellar neutron capture database KADoNiS
3. "rapid neutron capture process"
  - Production of neutron-rich exotic isotopes
  - $\beta$ -delayed neutrons
  - GSI experiments

# "Solar" abundances

Characteristic isotopic abundances for materials within the solar system  
⇒ also valid outside solar system? („Galactic“ abundances?)

H 1  
99,985  
 $\sigma$  0,332

How are  
the isotopes  
produced?

Ta 180  
0,012  
 $> 10^{15}$  a  
 $\epsilon$  8,15 h  
 $\beta^-$  0,7...  
 $\gamma$  93; 104  
 $\sigma \sim 560$  g

# Solar abundances: Production of light isotopes

**Big Bang nucleosynthesis:** H, He, D, no elements heavier than Li

**Galactic cosmic ray spallation:** Li, Be, B by bombardment of matter by high energy cosmic "ray" particles

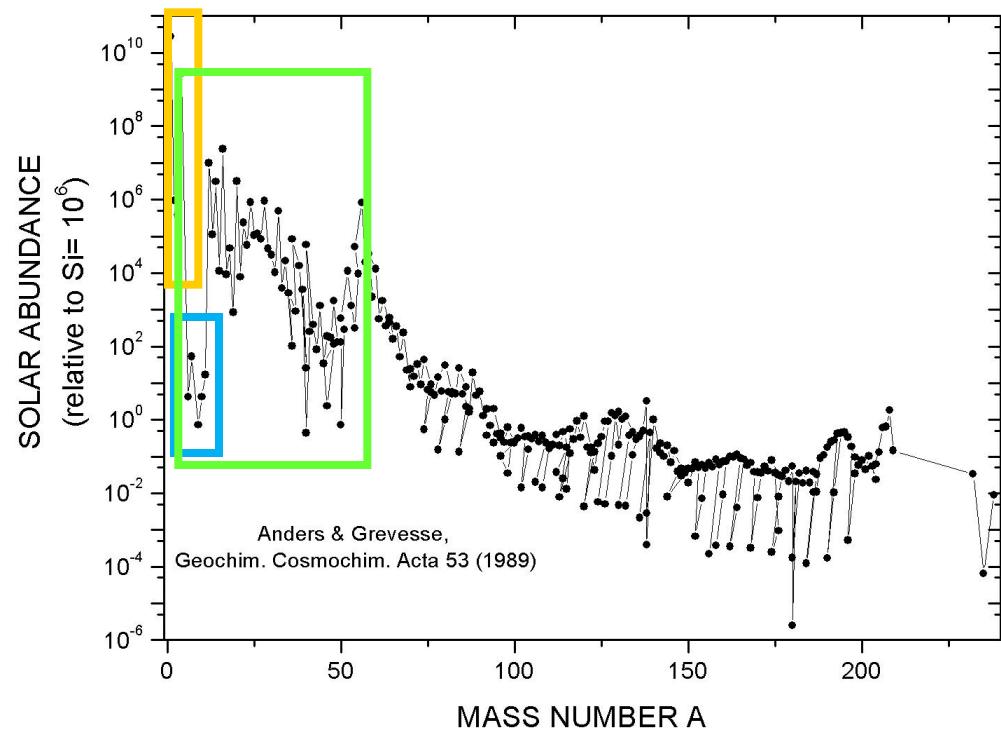

## Stellar nucleosynthesis 1:

Fusion (burning processes) in stars up to Iron and Nickel (A~56)

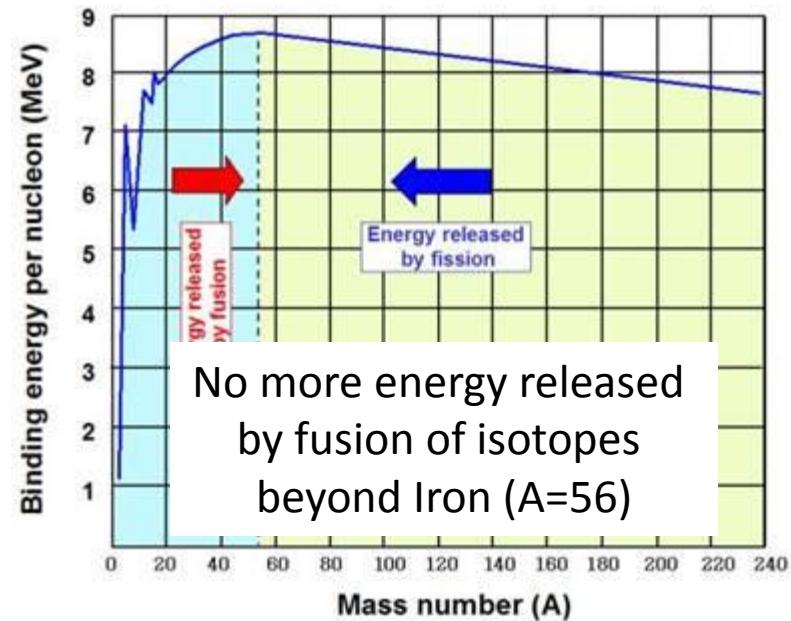

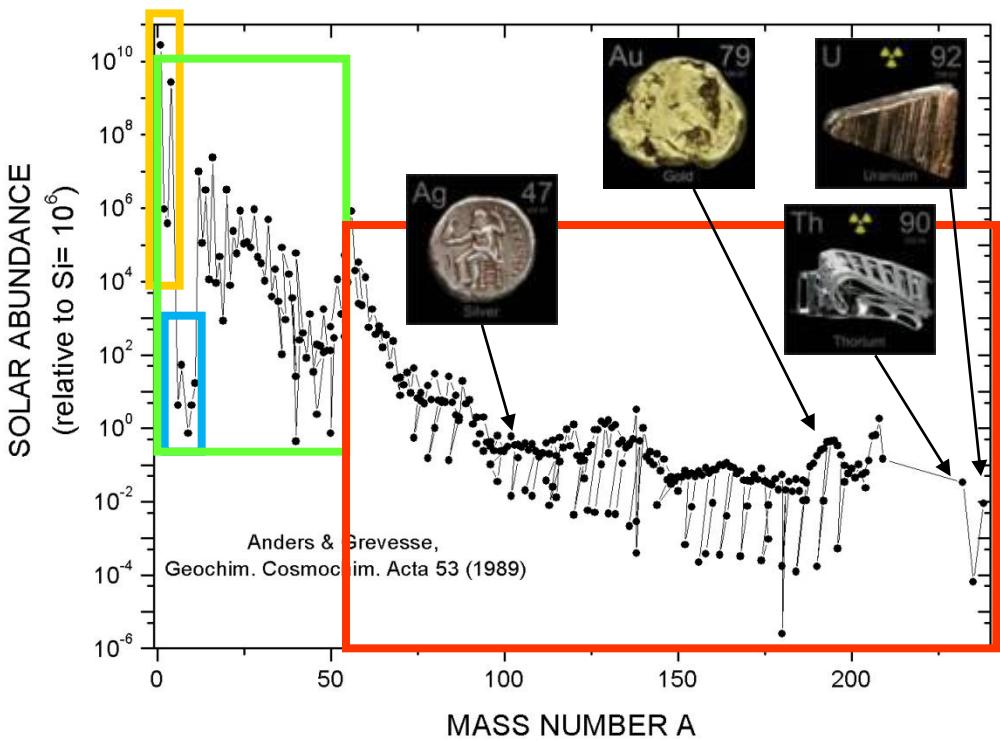

$0.08 - 0.4 M_{\odot} \Rightarrow$  H burning

$0.4 - \sim 8 M_{\odot} \Rightarrow$  H, He burning

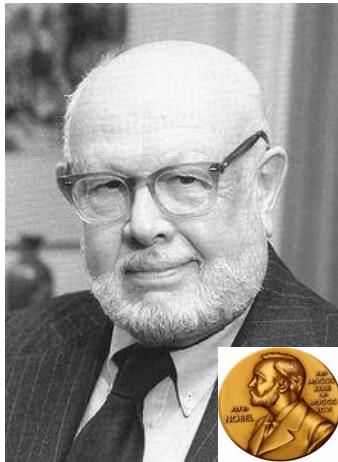

$> 8 M_{\odot} \Rightarrow$  H, He, C, Ne, O, Si  
burning

# How are the heavy elements formed?

# Nuclear Astrophysics = Nuclear Physics + Astrophysics

"Willy" Fowler (1911-1995)  
1983 Nobel Prize for Physics

Fred Hoyle  
(1915-2001)

B<sup>2</sup>FH: Burbidge, Burbidge, Fowler, Hoyle,  
Rev. Mod. Phys. 29 (1957)

## REVIEWS OF MODERN PHYSICS

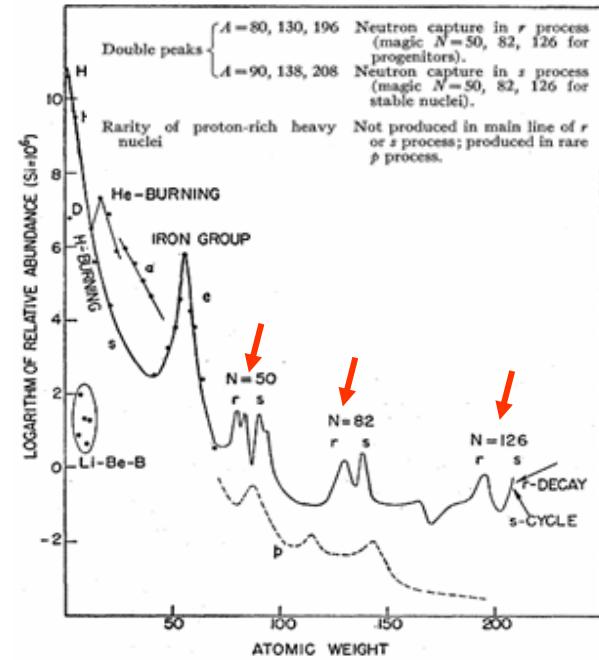

VOLUME 29, NUMBER 4

OCTOBER, 1957

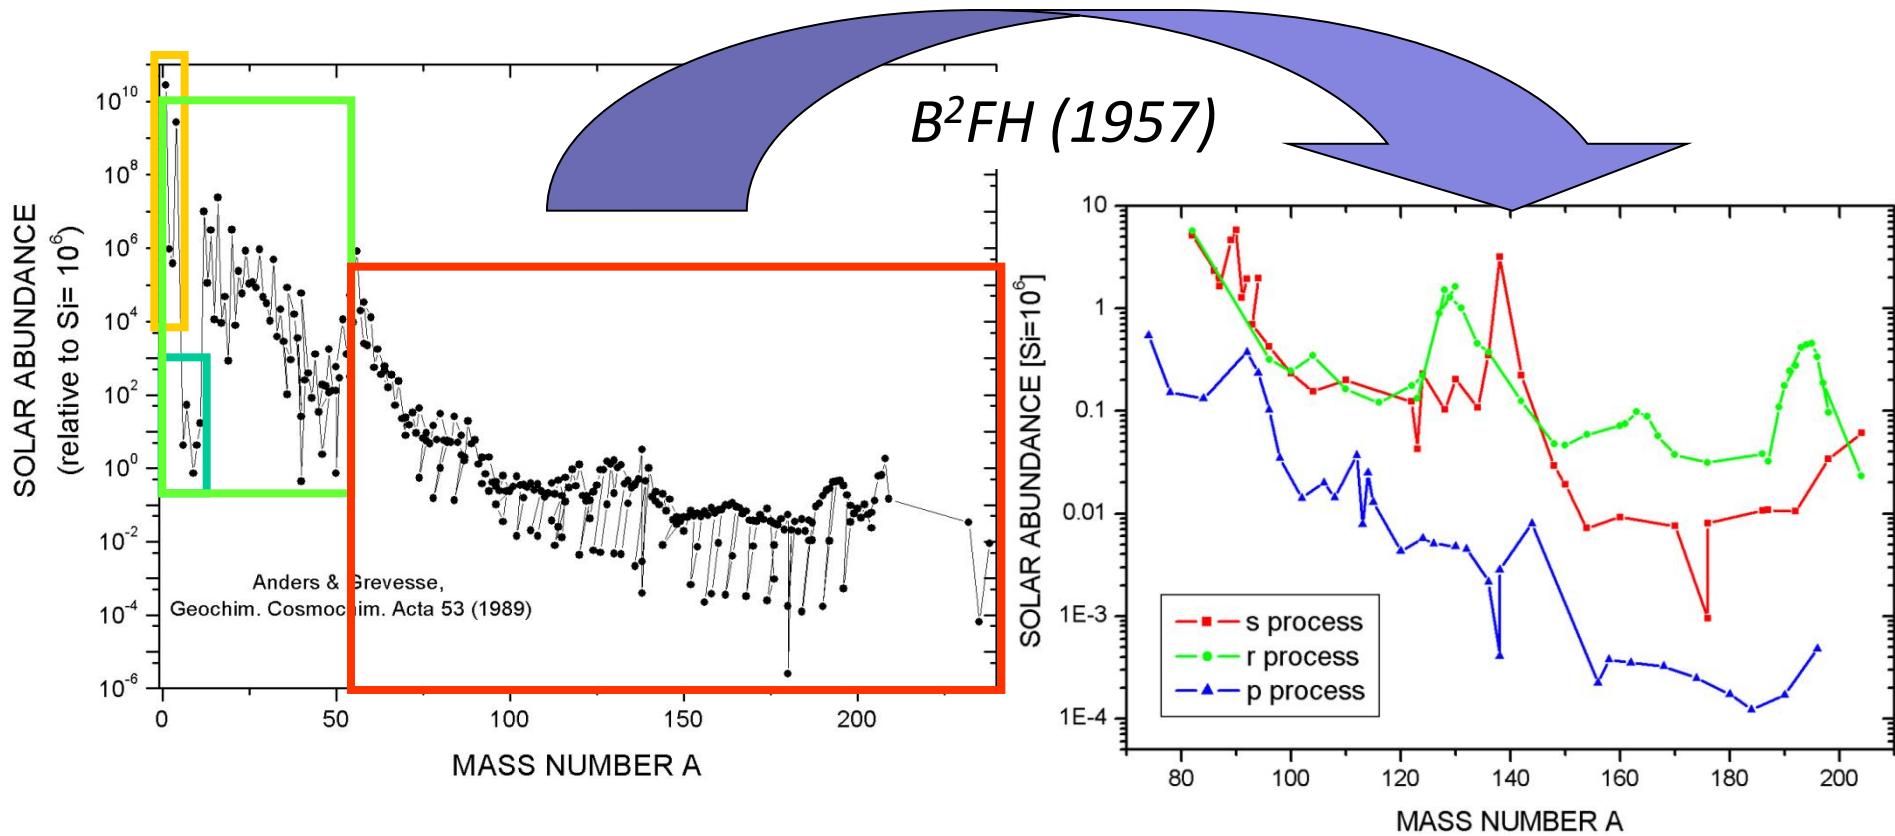

### Synthesis of the Elements in Stars\*

E. MARGARET BURBIDGE, G. R. BURBIDGE, WILLIAM A. FOWLER, AND F. HOYLE

Kellogg Radiation Laboratory, California Institute of Technology, and  
Mount Wilson and Palomar Observatories, Carnegie Institution of Washington,  
California Institute of Technology, Pasadena, California

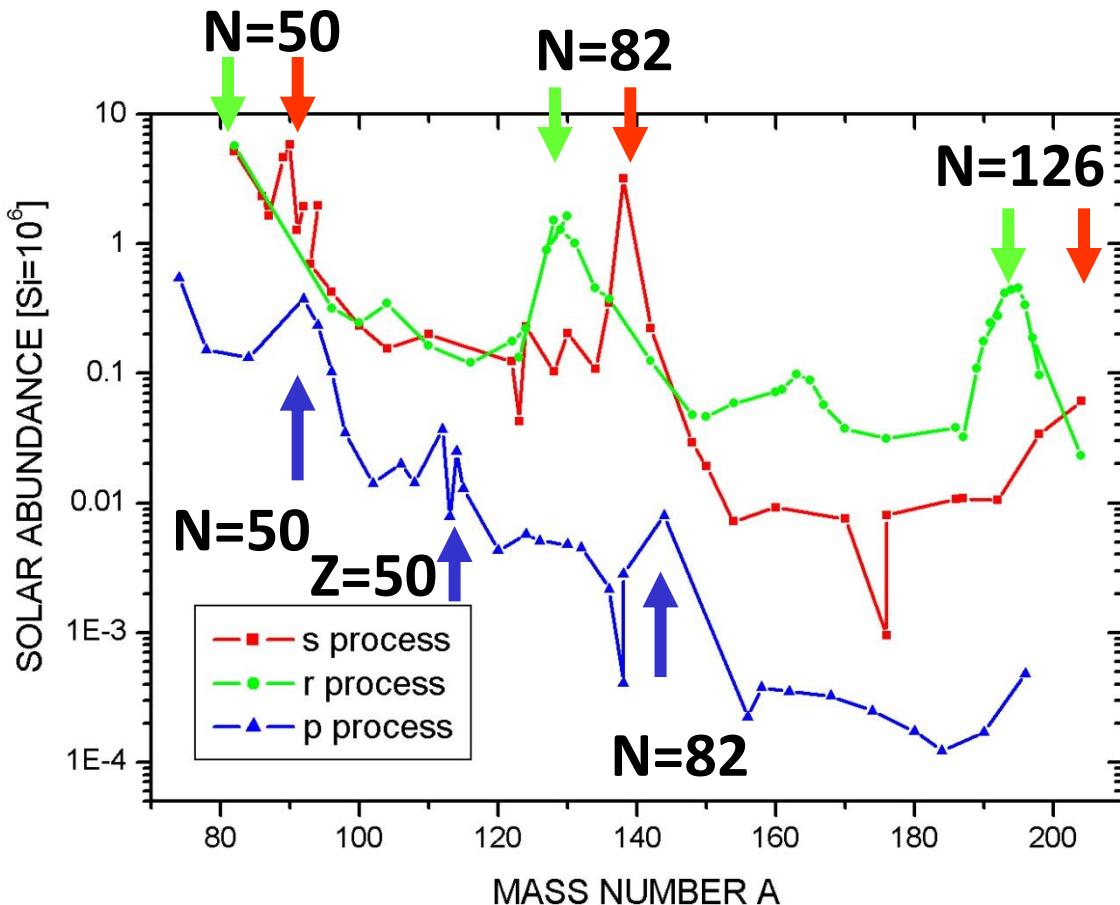

# Solar abundances: Synthesis beyond iron

$B^2FH$ : Burbidge, Burbidge, Fowler, Hoyle, Revs. Mod. Phys. 29 (1957)

# Solar abundances: Synthesis beyond iron

"slow neutron capture process"

"rapid neutron capture process"

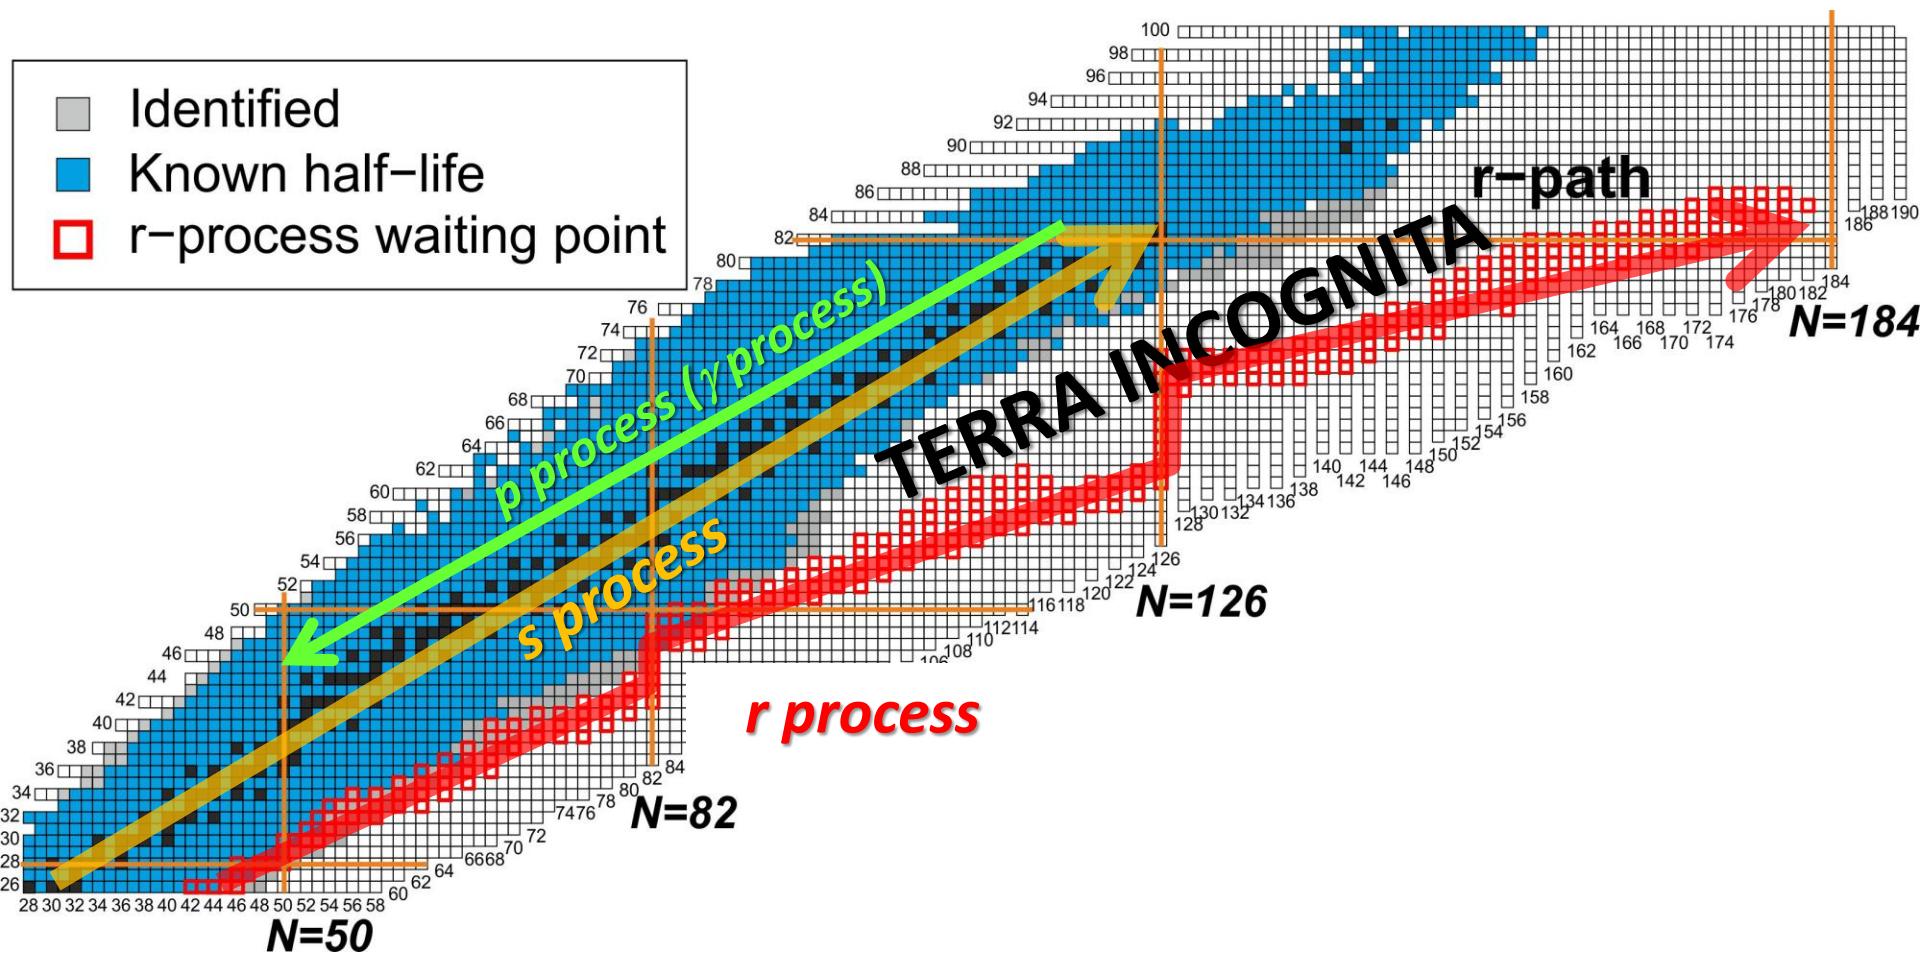

Production of p-rich isotopes

$$N_{\odot} = N_s + N_r + N_p$$

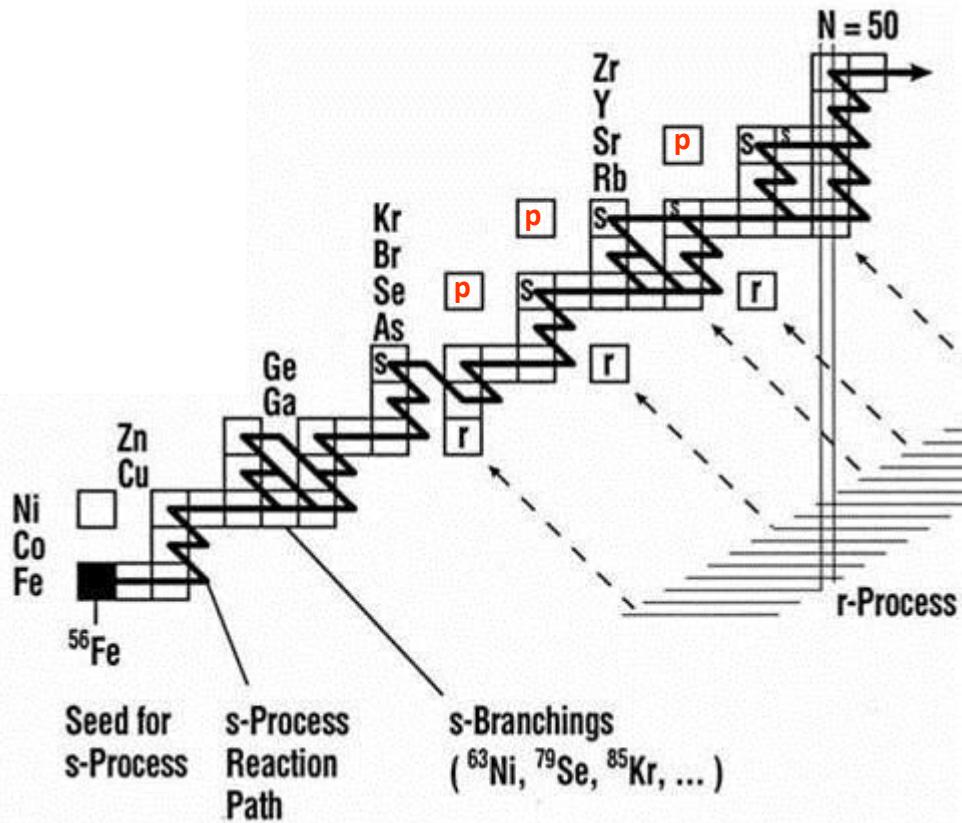

$\sim 50\%$     $\sim 50\%$     $\sim 1\%$

*Local abundance maxima (and minima) are mirrors of nuclear structure  
(shell closures, pairing effects...)*

# Solar abundances: Synthesis beyond iron

# The "slow neutron capture process"

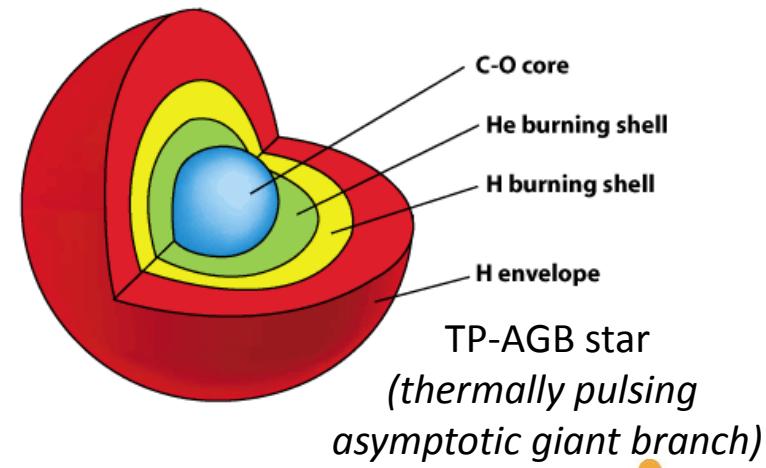

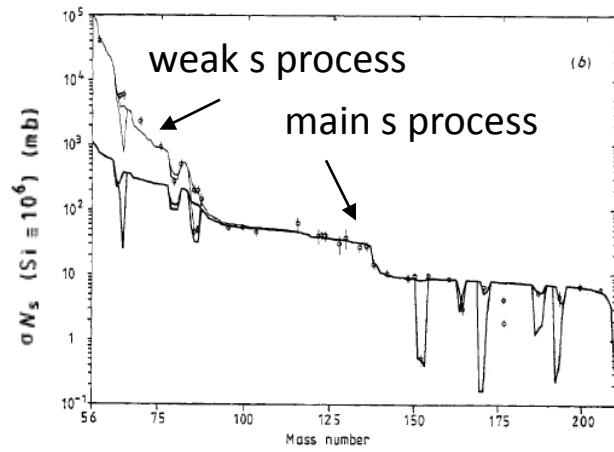

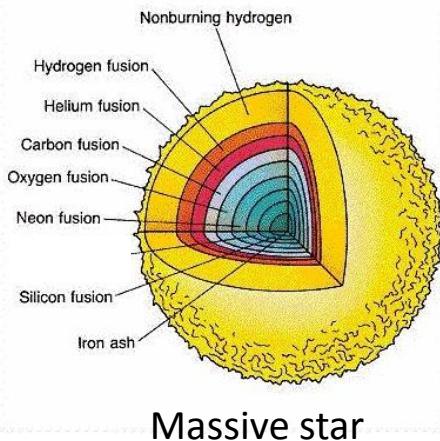

~50% of abundances >Fe

- Neutron capture slowly compared to  $\beta$ -decay (1 capture per  $\sim 1000$  y)
- Well defined path along line of stability
- Almost completely understood from astrophysical and nuclear physics side
- End point:  $^{209}\text{Bi}$

KADoNiS

- Compilation, not evaluation!
- Since April 2005
- $^1\text{H} - ^{210}\text{Po}$
- 357 isotopes: 280 stable (267 measured), 77 radioactive (13 measured)
- Maxwellian cross sections (MACS) and stellar enhancement factors for  $kT = 5-100 \text{ keV}$
- Experimental and theoretical predictions
- ( $n,p$ ) and ( $n,\alpha$ ) reactions for light isotopes
- Based on previous compilations:

B.J. Allen, R.L. Macklin, J.H. Gibbons, Adv. Nucl. Phys. 4 (1971) 205

### Available isotopes for Selenium (Z=34)

$^{74}\text{Se}$   $^{76}\text{Se}$   $^{77}\text{Se}$   $^{78}\text{Se}$   $^{79}\text{Se}$   $^{80}\text{Se}$   $^{82}\text{Se}$

Go to isotope  Go!

### Recommended MACS30 (Maxwellian Averaged Cross Section @ 30keV)

Total MACS at 30keV:  $271 \pm 15$  mb

Cross sections do not include stellar enhancement factors!

### History

Version	Total MACS [mb]	Partial to gs [mb]	Partial to isomer [mb]
0.2	$271 \pm 15$	-	-
0.0	$267 \pm 25^*$	-	-

(Version 0.0 corresponds to Bao et al.)

### Comment

Previous MACS vs. kT table multiplied by 1.015.

Last review: January 30th, 2006

### List of all available values

original	renorm.	year	type	Comment	Ref
$271 \pm 15$		2006	c	VdG, Act., Au:RaK88	DHK06a
160		1971	s		AGM71
209.0		2006	e		endfb7
156.0		2004	e		jeff31
209.0		2002	e		jendl33
201		2000	t		RaT99
$96 \pm 31$		1988	t		ZZC88
193		1981	t		Har81
360		1978	t		WFH78
301		2002	t	MOST 2002	Gor02
245		2005	t	MOST 2005	Gor05

**Original:** MACS [ $\langle\sigma v\rangle/v_{\gamma}$ ] (mb) for  $kT=30$  keV, based on the published cross sections except where indicated otherwise.

**Renorm:** MACS [ $\langle\sigma v\rangle/v_{\gamma}$ ] (mb) for  $kT=30$  keV for which the reference or standard cross section was meanwhile improved.

**Type:** The letters and numbers in the column labelled 'type' give information on how the cross section has been obtained:

c Directly quoted from the reference itself

s Semiempirical estimates given in the reference

e Evaluated value taken directly from the reference

t Theoretical value

### MACS, SEF and Reaction Rates for different energies

Energy	5keV	10keV	15keV	20keV	25keV	30keV	40keV	50keV	60keV	80keV	100keV
MACS	687	473	384	332	296	$271 \pm 15$	235	212	195	173	159
SEF	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00
Rate	4.09	3.98	3.96	3.95	3.94	3.95	3.96	3.99	4.02	4.12	4.25

### MACS:

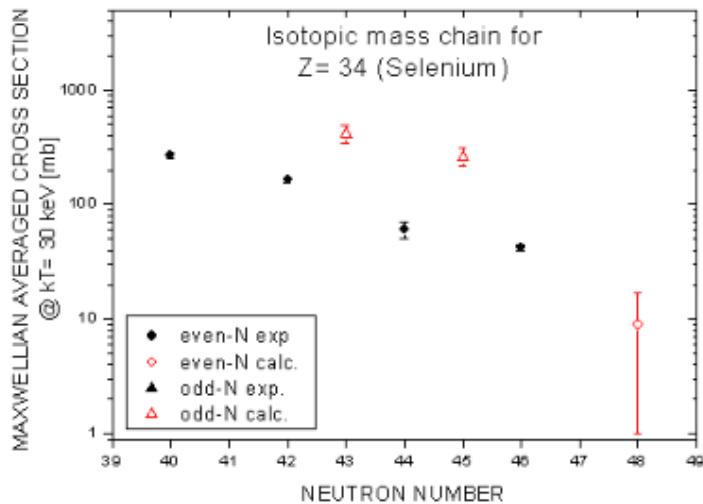

Reference: DHK06a,RaT99

Procedure: 'e+t' (The MACS from  $kT=5$  keV to 100 keV are derived from calculated cross sections, which are then normalized to experimental data, e.g. to the values at  $kT=25$  keV obtained in activation measurements. In these cases the uncertainties should be linearly increased below 25 and above 30 keV to reach about 30% at the extreme kT values.)

Year: 2000,2006

# Comparison with ENDF/B-VII.0

# KADoNiS

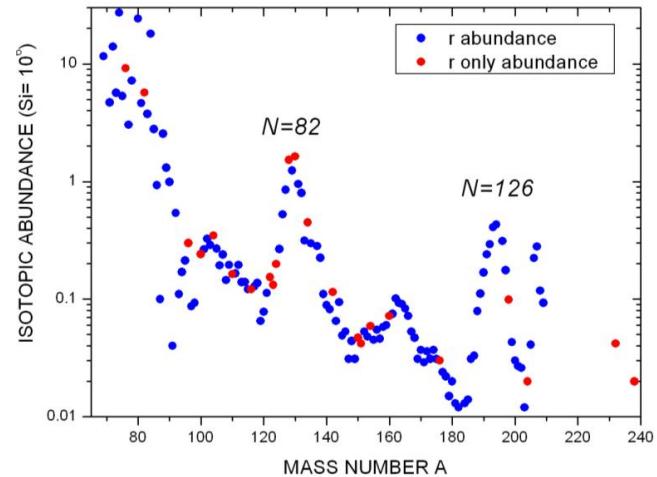

# The "rapid neutron capture process"

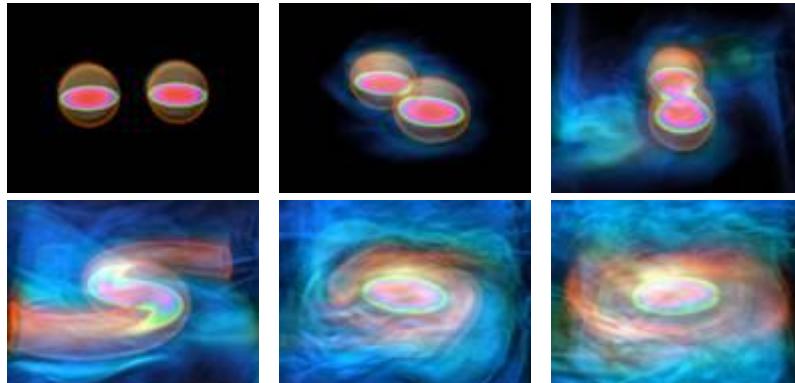

# The "rapid neutron capture process"

$$N_r = N_{\odot} - N_s$$

- High neutron densities ( $n_n \gg 10^{20} \text{ cm}^{-3}$ )  
⇒ ~1 ms per capture
- “Moderate” temperatures ( $T=1-2 \text{ GK}$ )  
⇒  $^{56}\text{Fe}$  to ~Pu ( $Z=94$ ,  $A \sim 260$ ) in few seconds
- End point: fission barriers (theory!) ⇒ “fission recycling” ( $2x A \sim 130$ )
- Astrophysical scenario: still under discussion

Neutron star mergers?

Core collapse supernova ?

# Input for network calculations

During equilibrium phase:

## Astrophysical parameters

Neutron density ( $n_n \geq 10^{20} \text{ cm}^{-3}$ )

Temperature ( $T > 1 \text{ GK}$ )

Duration of neutron exposure (few seconds)

Half-lives (s- ms): Shape

Masses ( $S_n \approx 2-3 \text{ MeV}$ ,  $Q_\beta$ ): Path

*Calculation of progenitor abundances*

## Nuclear physics parameters: Experiments + Theory

During “Freeze out” phase:

$(n,\gamma)/(\gamma,n)$  cross sections

**$\beta$ -delayed neutron emission ( $P_n$ )**

$Z > 80$ : fission barriers,  $\beta$ -delayed fission,

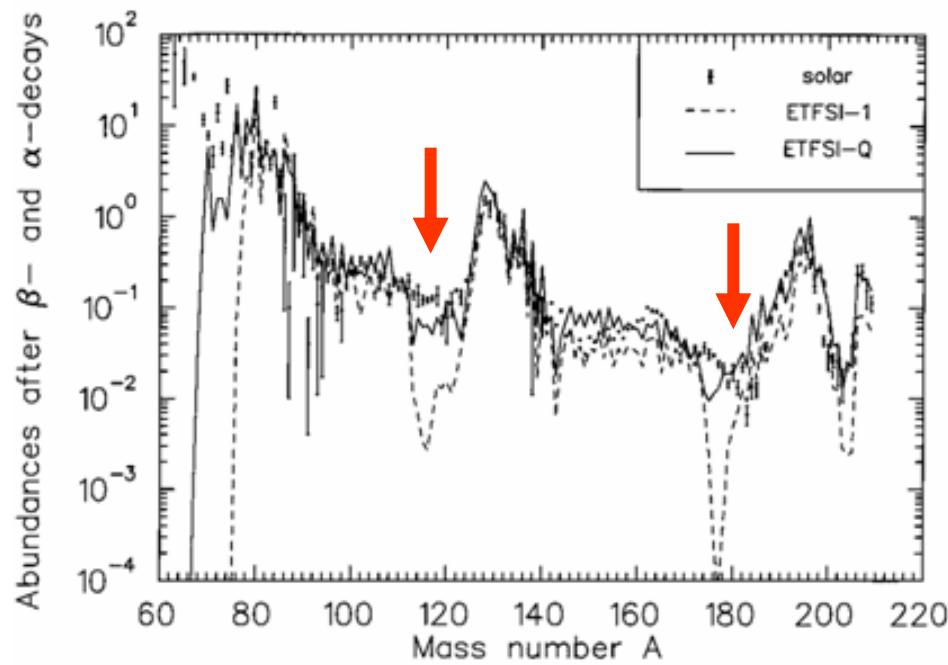

$(n,f)$ -cross sections

$t_{1/2}(\alpha)$  for  $A > 210$

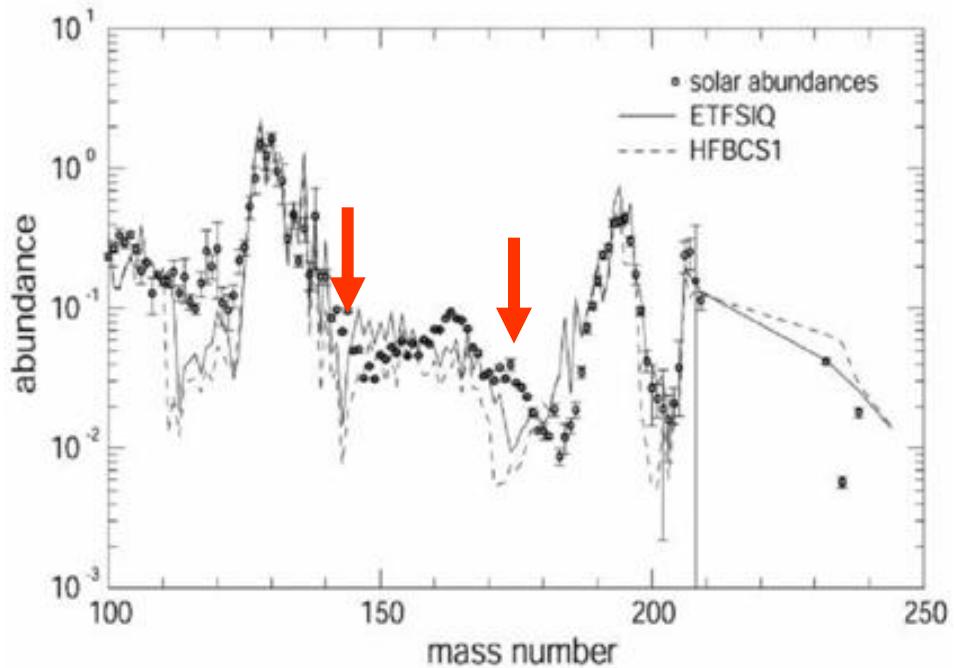

*Comparison with solar r abundances*

# r-process calculations vs. solar

- Strongly dependent on mass models!

C. Freiburghaus et al., Ap. J. 516 (1999) 381

H. Schatz et al., Ap. J. 579 (2002) 626

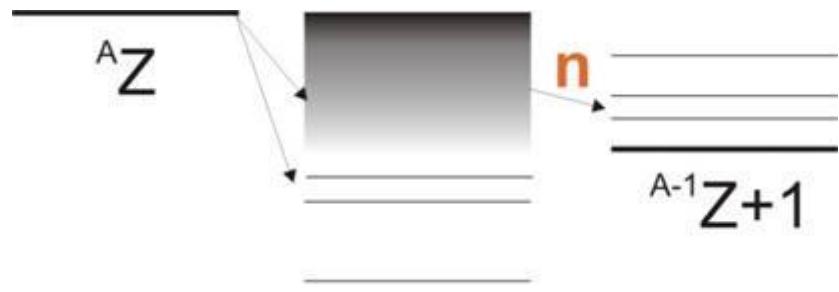

# $\beta$ -delayed 1 and 2 neutron emission ( $P_{1n}$ , $P_{2n}$ )

$$S_n < Q_\beta$$

Important nuclear structure information

$P_n$  :  $\beta$ -strength above  $S_n$

$t_{1/2}(^A Z + 1)$ : sensitive to low-lying  $\beta$ -strength

From time-dependence of n-emission:  $t_{1/2}(^A Z)$

$$S_{2n} < Q_\beta$$

First experimental identification:

-  $^{11}\text{Li}$  ( $t_{1/2} = 8.6$  ms) @ISOLDE:

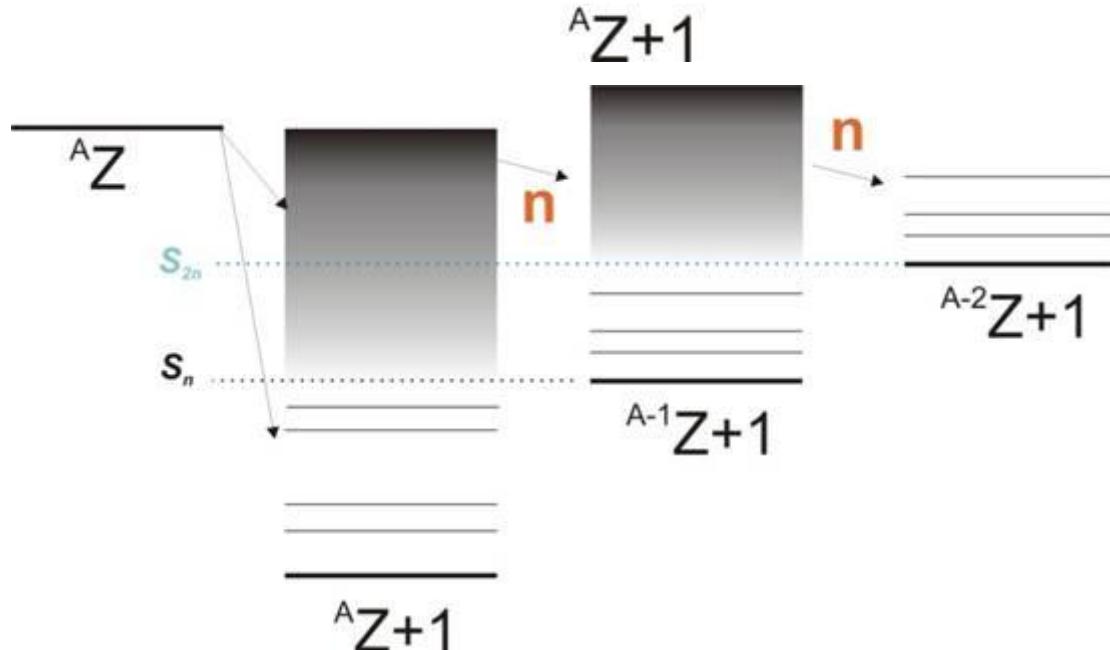

Azuma et al., PRL 43, 1652 (1979)

-  $^{30-32}\text{Na}$  ( $t_{1/2} = 13-48$  ms) @ISOLDE:

Detraz et al., Phys. Lett. 94B, 307 (1980)

-  $^{98}\text{Rb}$  ( $t_{1/2} = 114$  ms) @TRISTAN:

Reeder et al., PRL 47, 483 (1981)

- ▶ Accurate mass measurements needed for predictions!

30 high pressure  ${}^3\text{He}$  long counters  
PE matrix, size  $\sim 1\text{m}^3$

M.B. Gómez Hornillos et al., Proc. Int. Conf. on Nucl. Data for Science and Techn. (2010)

# Silicon IMplantation detector and Beta Absorber

**SIMBA**  
Constructed and  
developed at

**TUM**  
Technische Universität München

**Lehrstuhl E12**

- 1 x- and 1 y-detector, 60x segmented each
- 2 SSSD, 7x segmented in x
- 3 DSSD (implantation area): 60x segmented in x-,  
40x in y-direction
- 2 SSSD, 7x segmented in x

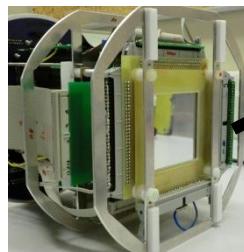

PhD thesis C. Hinke, TUM (2010)  
Diploma thesis K. Steiger, TUM (2009)

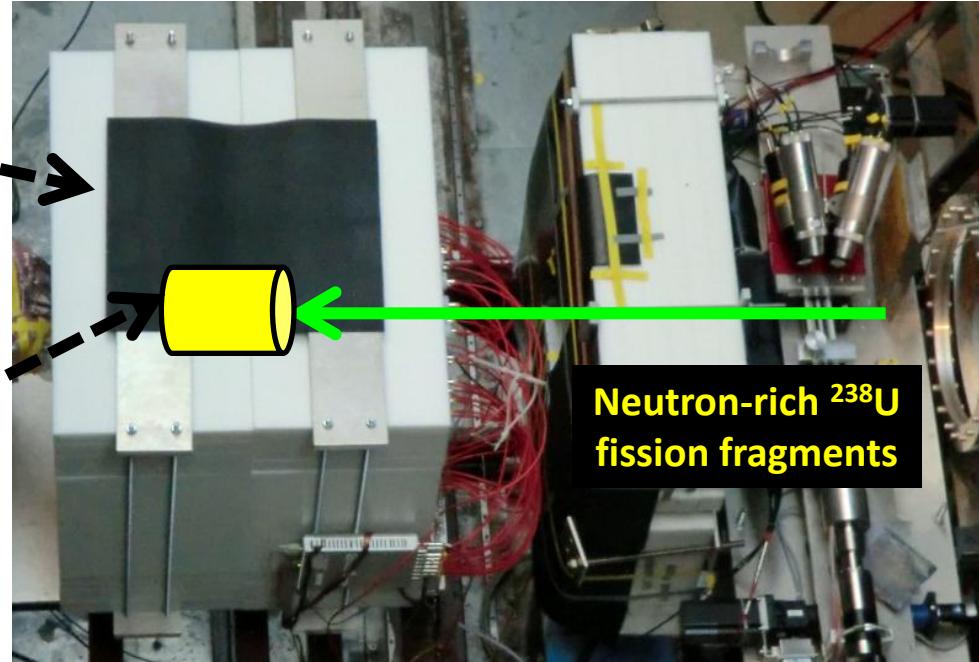

Pictures: K. Steiger

# Setup at the FRS (Summer 2011)

Neutron detector BELEN-30

Implantation detector  
SIMBA

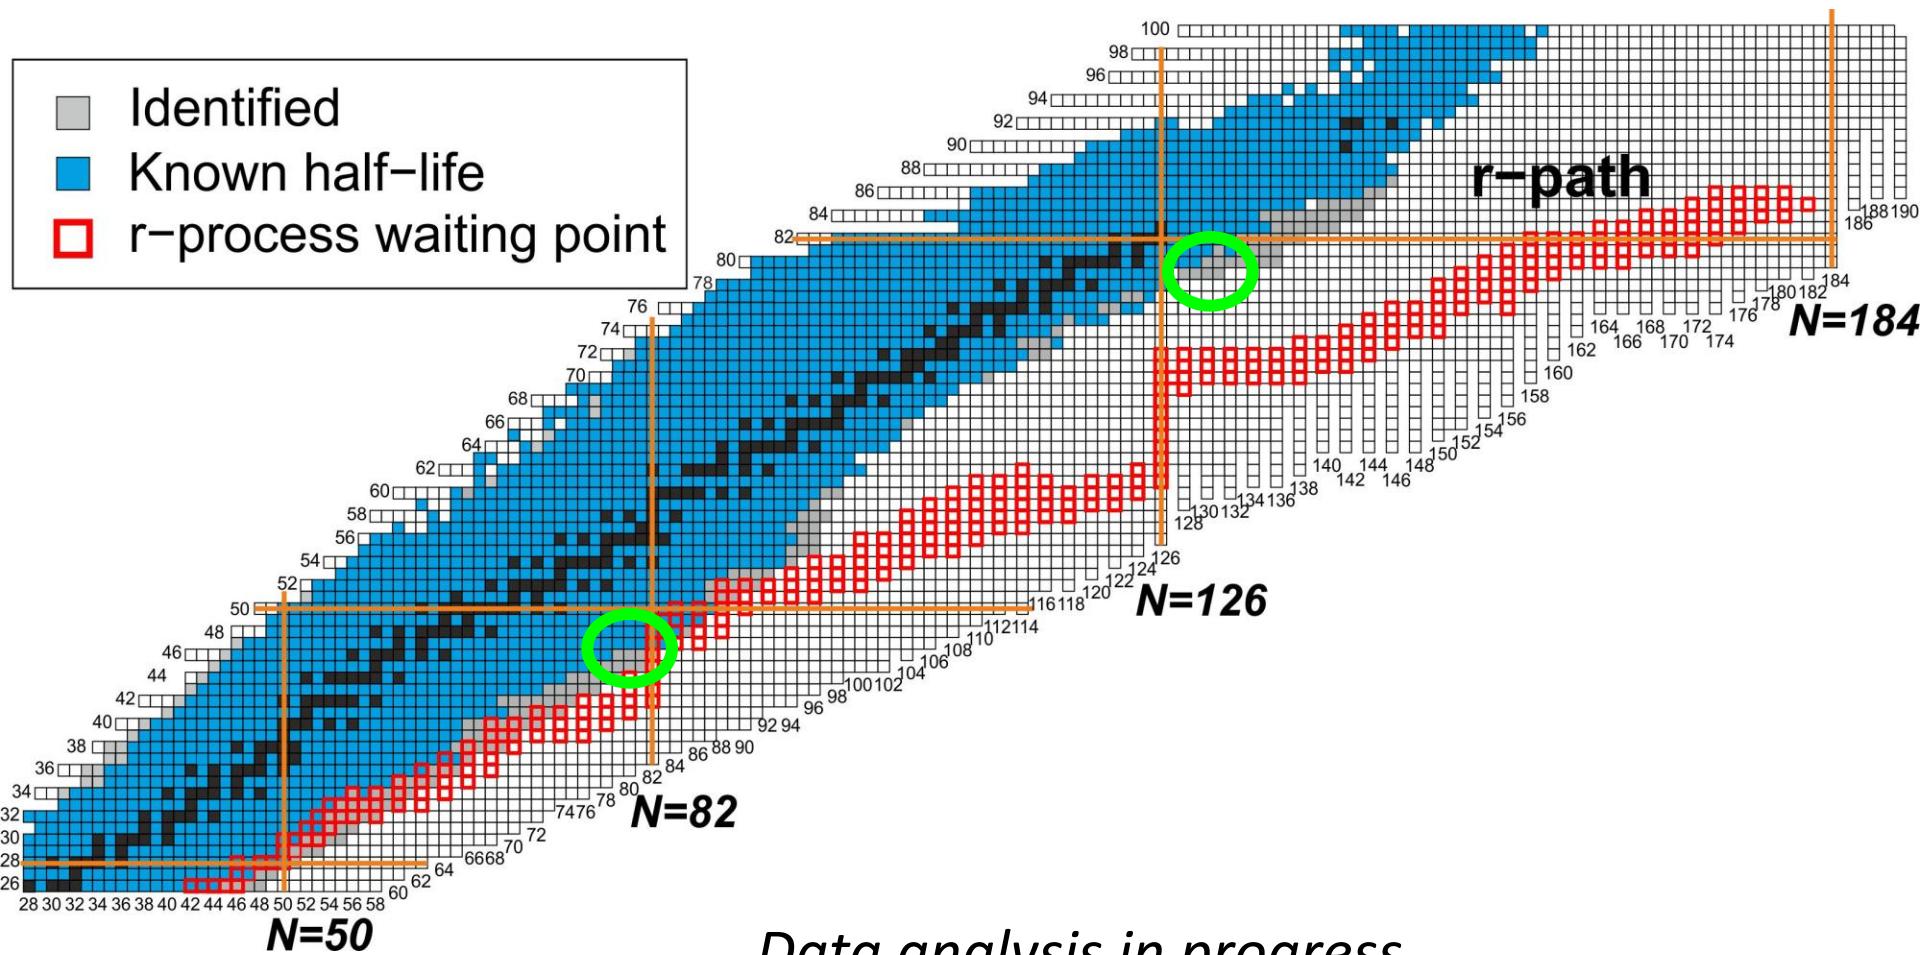

Next steps:

- Upgrade of detector: up to 90 counters (detection efficiency ~70%): collaboration with Dubna
- Measure  $P_{xn}$
- Prepare for first experiments @FAIR/DESPEC (>2018)

# $\beta\text{dn}$ measurements at GSI Darmstadt

2 weeks beamtime in September 2011

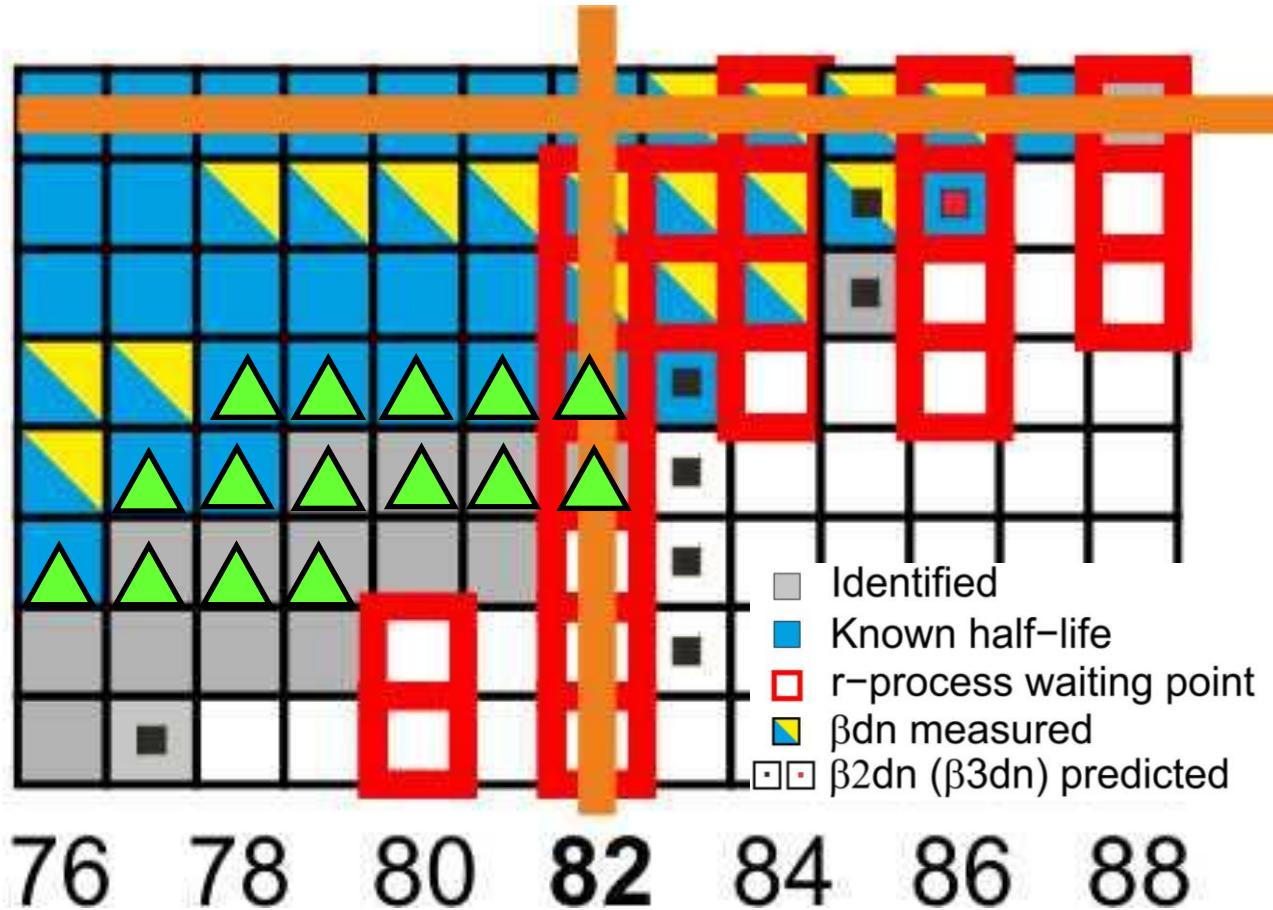

- Identified
- Known half-life
- r-process waiting point

*Data analysis in progress*

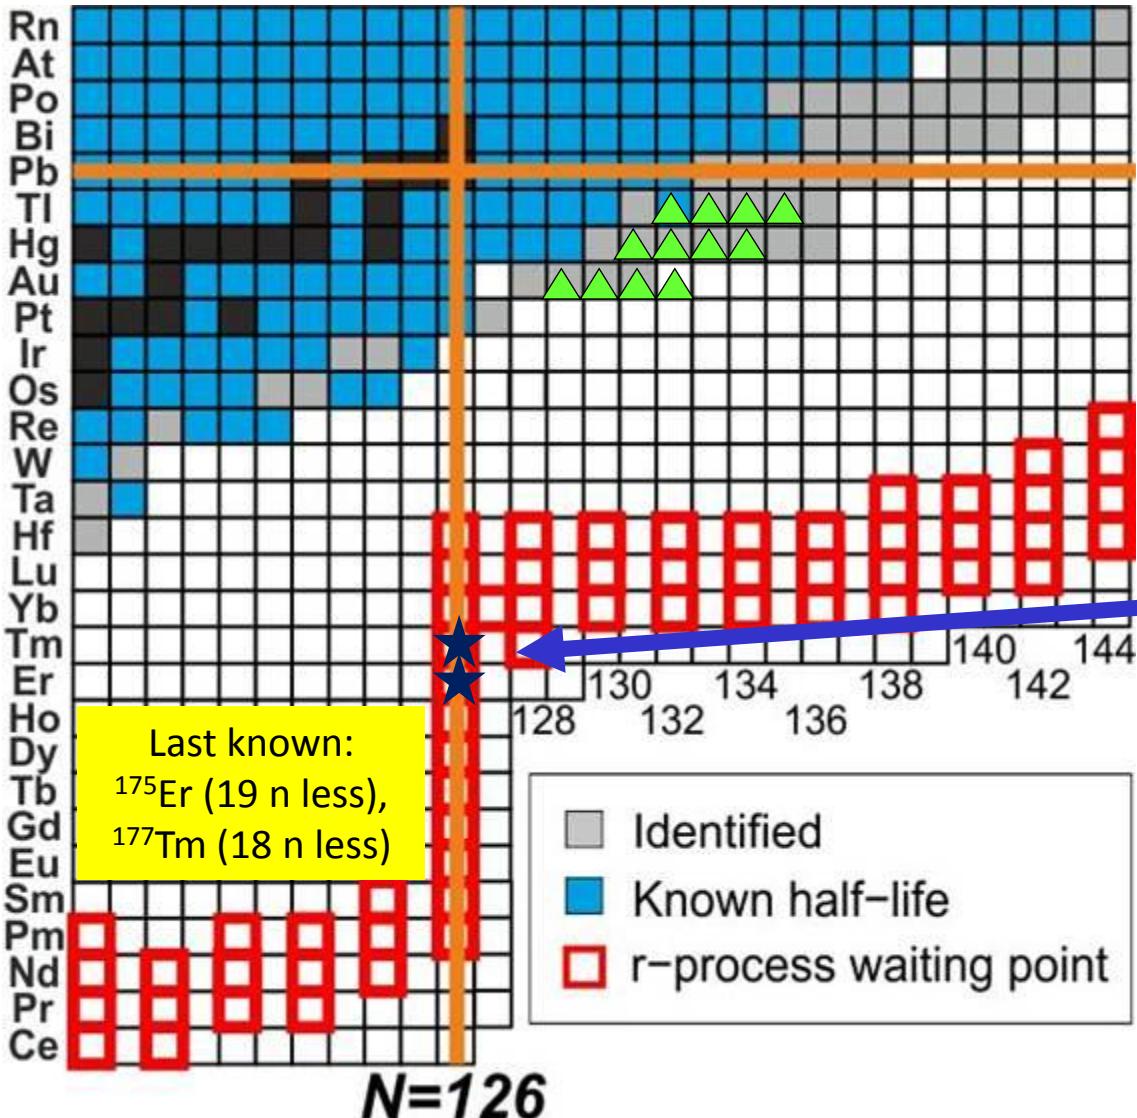

# N=82: Status and S323 proposal

Sn ( $Z=50$ )  
In ( $Z=49$ )  
Cd ( $Z=48$ )  
Ag ( $Z=47$ )  
Pd ( $Z=46$ )  
Rh ( $Z=45$ )  
Ru ( $Z=44$ )  
Tc ( $Z=43$ )

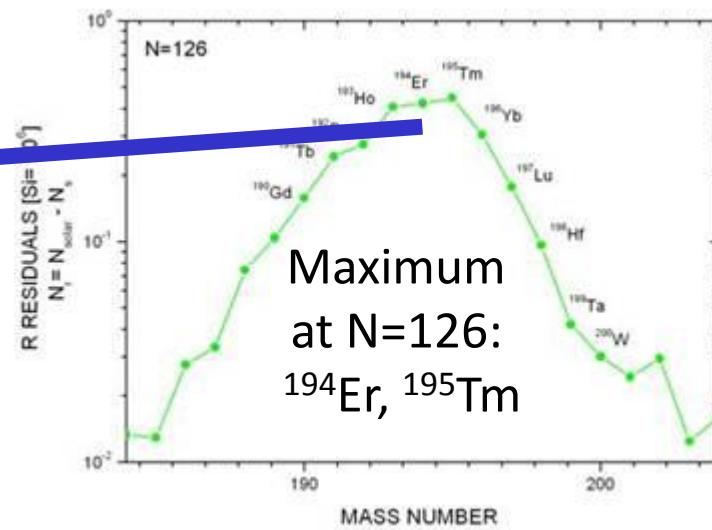

GSI proposal

# N=126: Status and S410 proposal

▲ GSI proposal

*Will be heaviest  $\beta dn$ -emitters measured so far*

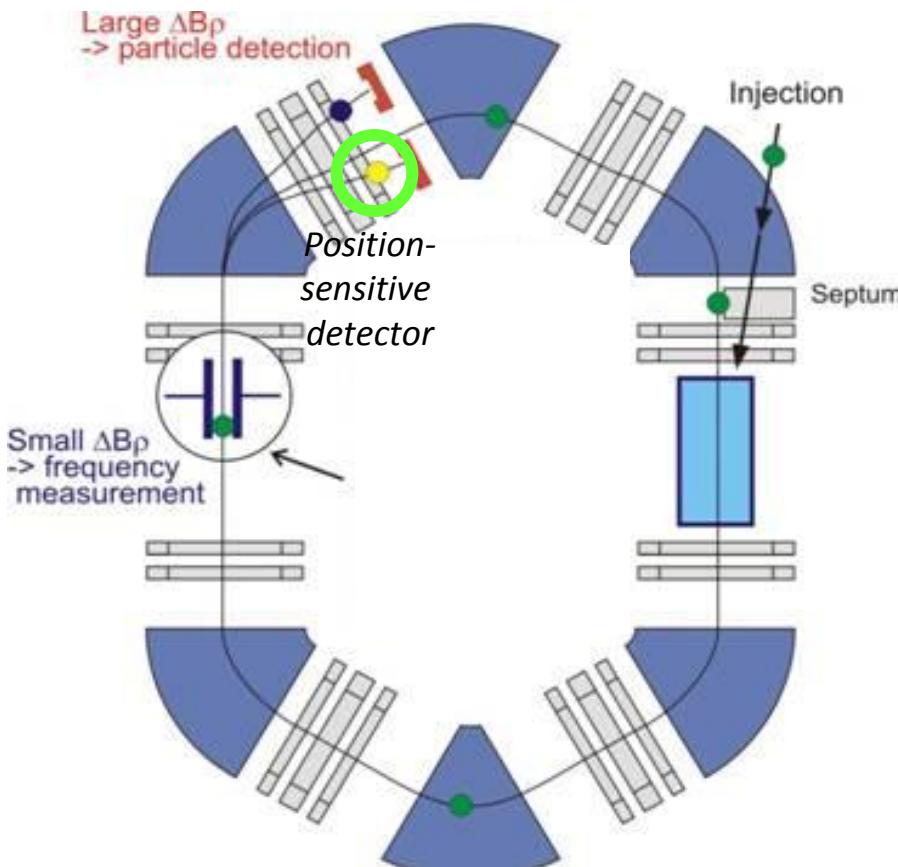

*...still long way to go...*

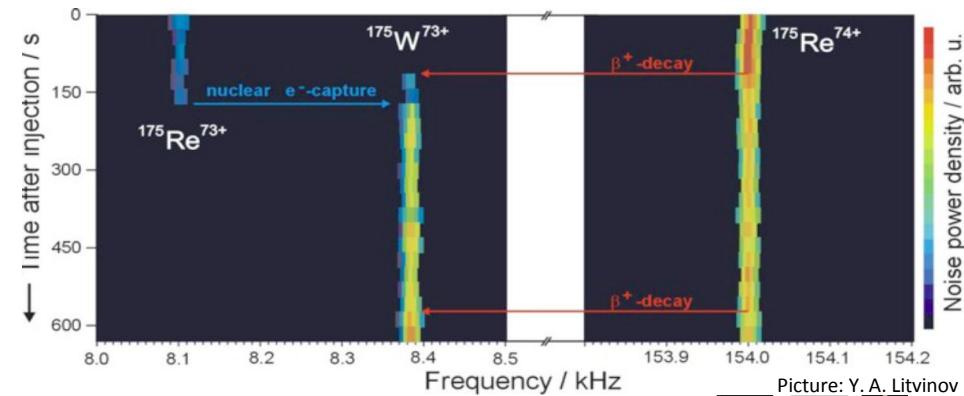

# Outlook 1: $\beta$ dn in a storage ring?

Problems: High price of  $^3\text{He}$  detectors due to shortage; Energy-dependent efficiencies

► alternative methods?

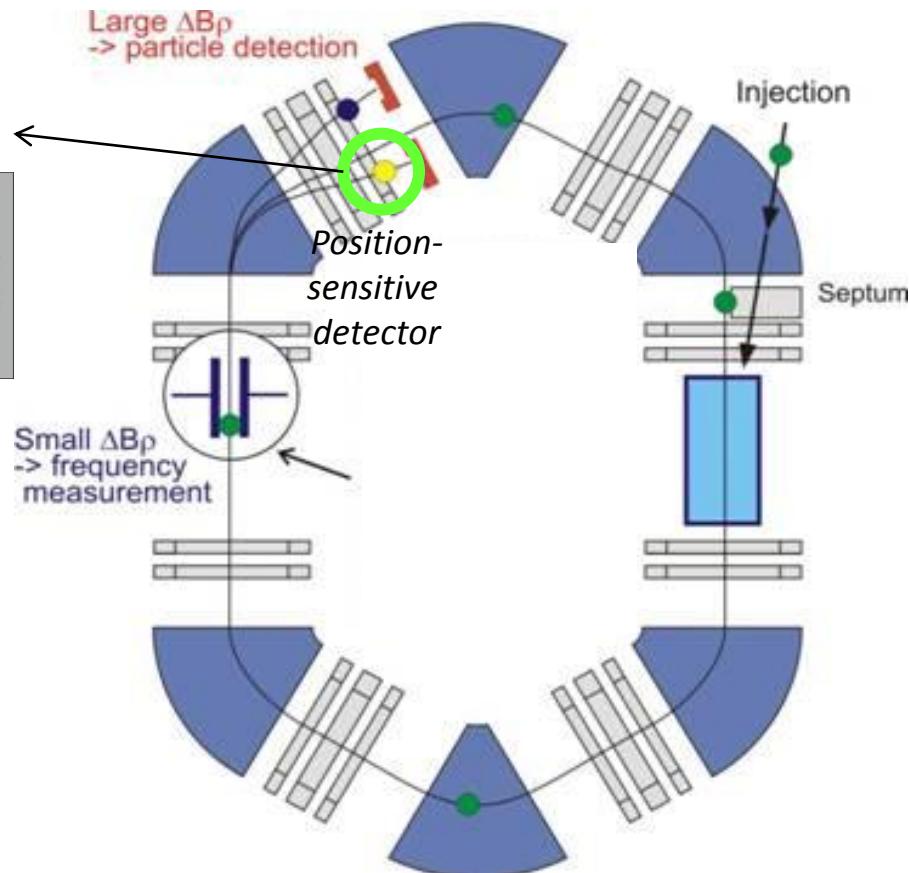

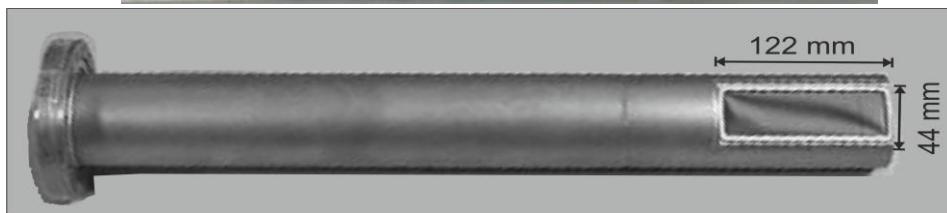

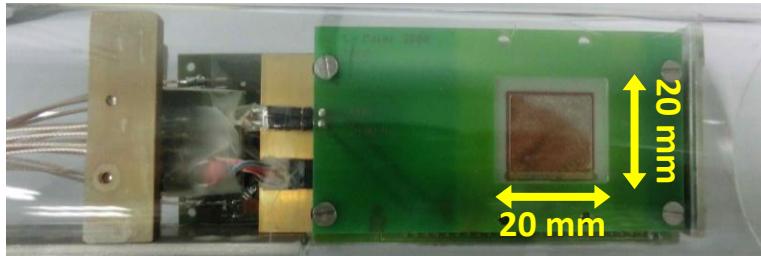

- Fully ionized  $\beta$ dn-mother  $^A_Z$  inserted into ESR
- Few (<10) ions  $^A_Z$  circulating (500 ns/turn): Half-lives down to ms and  $\mu\text{s}$
- If decay in straight sections: deflection in next dipole  
2 possibilities:
  - $\Delta B_p < 3\%$  ►  $\beta$ -decay and  $\beta$ dn: detected with Schottky pickups
  - $\Delta B_p > 3\%$  ► detection with position sensitive detector

Picture: Y. A. Litvinov

# Outlook 1: $\beta\text{dn}$ in a storage ring?

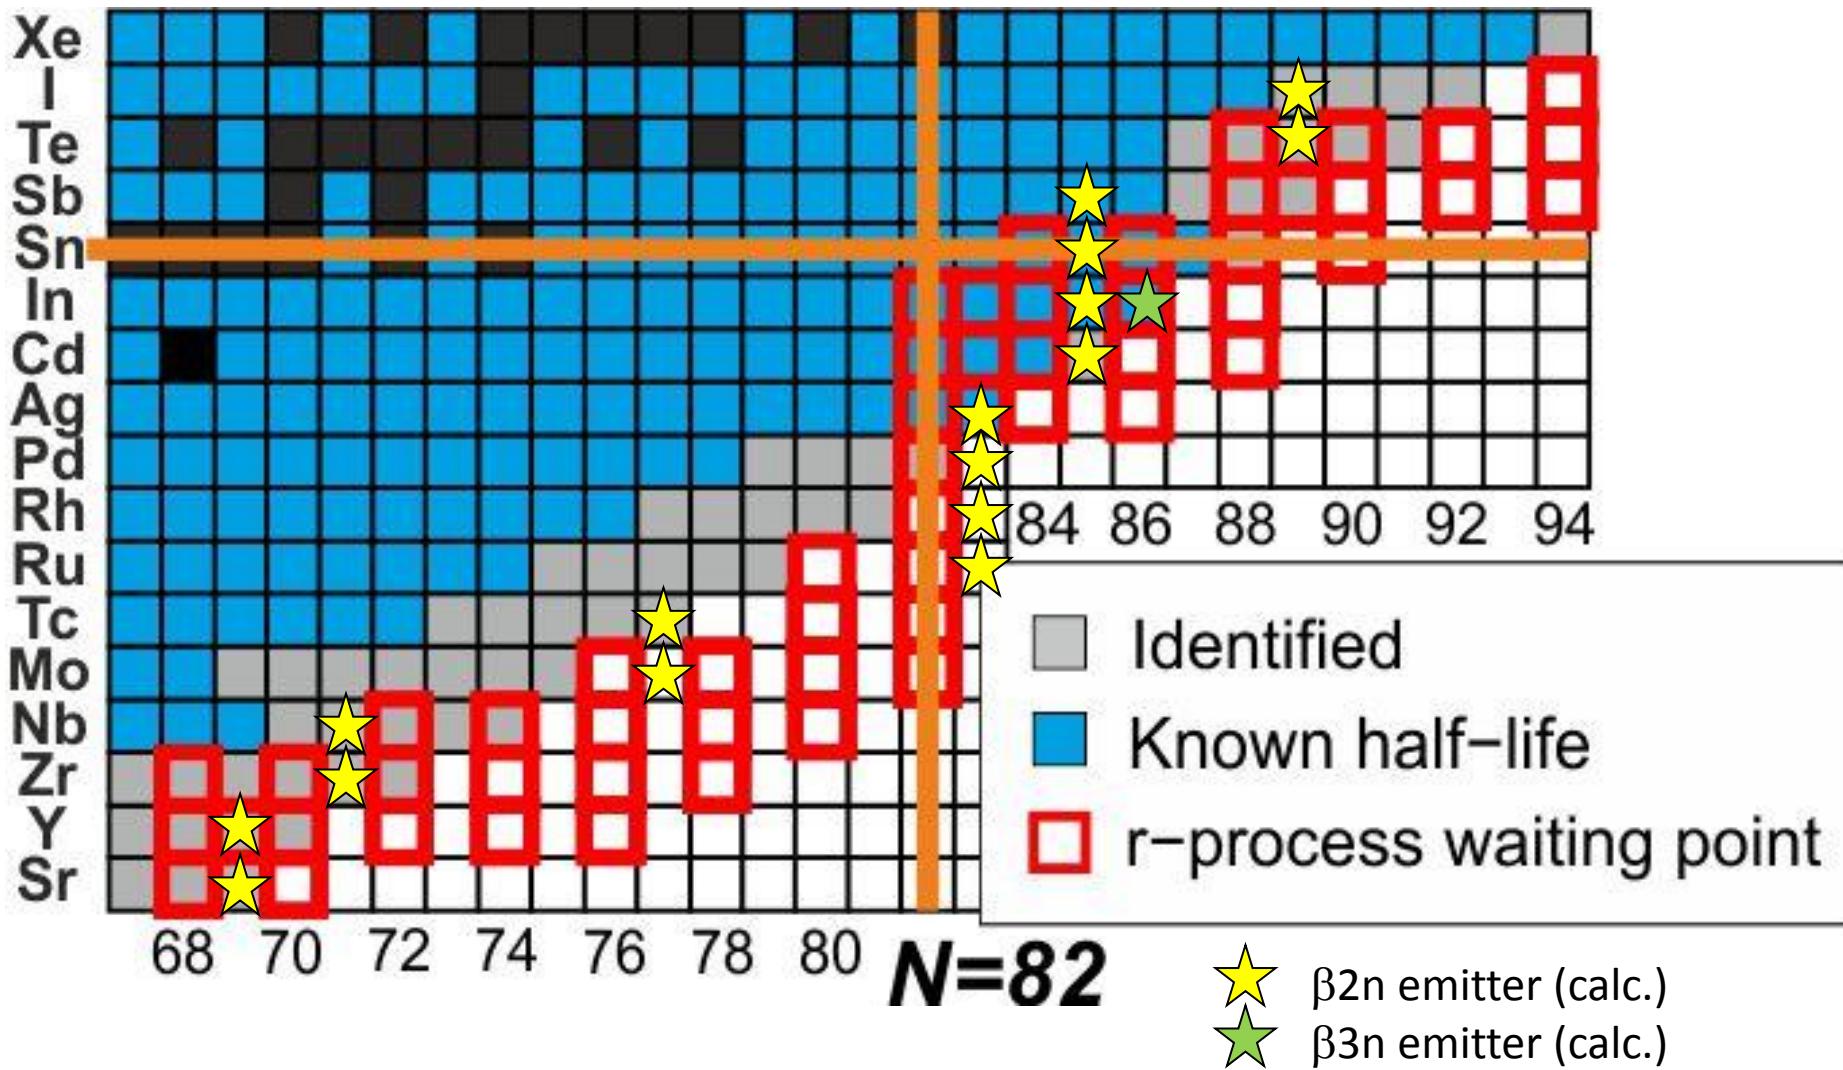

## Problems

- Losses due to transfer from FRS into ESR
- Short-lived isotopes ( $t_{1/2} < 1$  s): No electron cooling possible
  - ▶ Test with longer-lived  $\beta\text{dn}$ -emitters ( $A \sim 210$ )
- Reconstruction and identification of mother
- Low detection efficiency (▶ 2nd detector)

*Complementary method: no detection of neutron,  
independent of neutron energy*

# Outlook 2: Measure $P_{2n}$ and $P_{3n}$

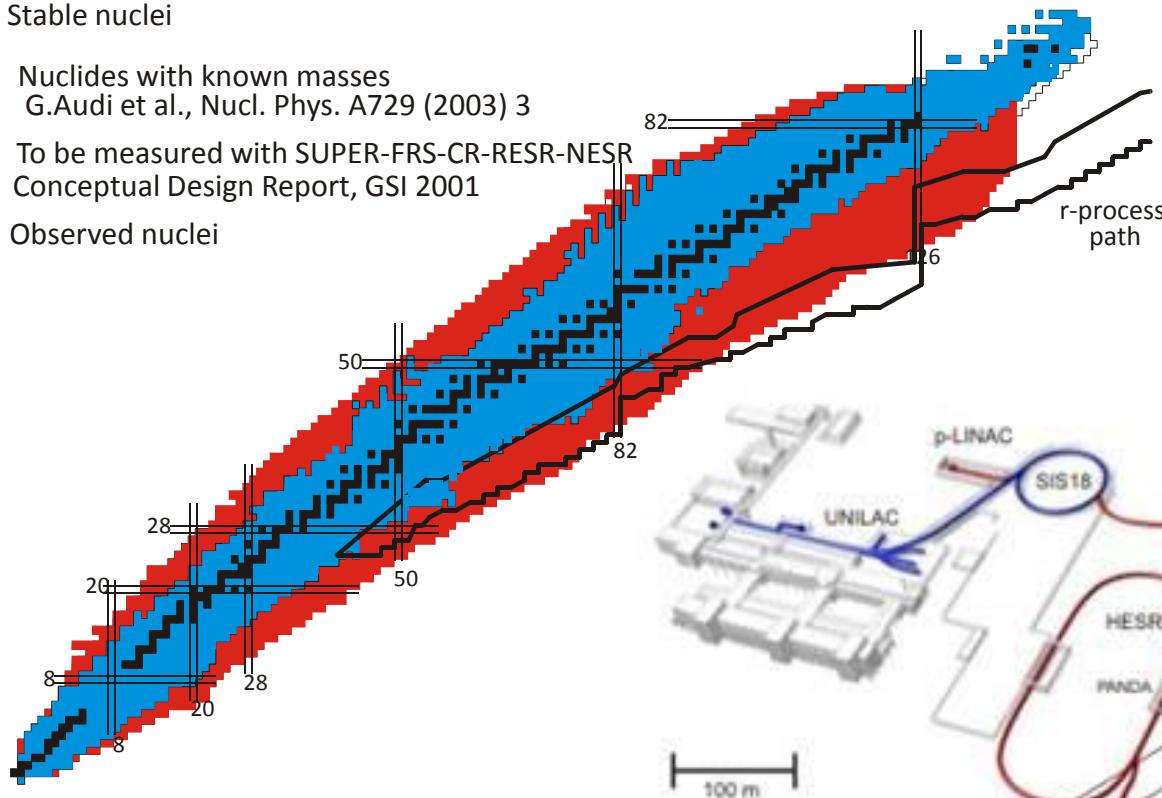

# Outlook 3: RIB facilities

■ Stable nuclei

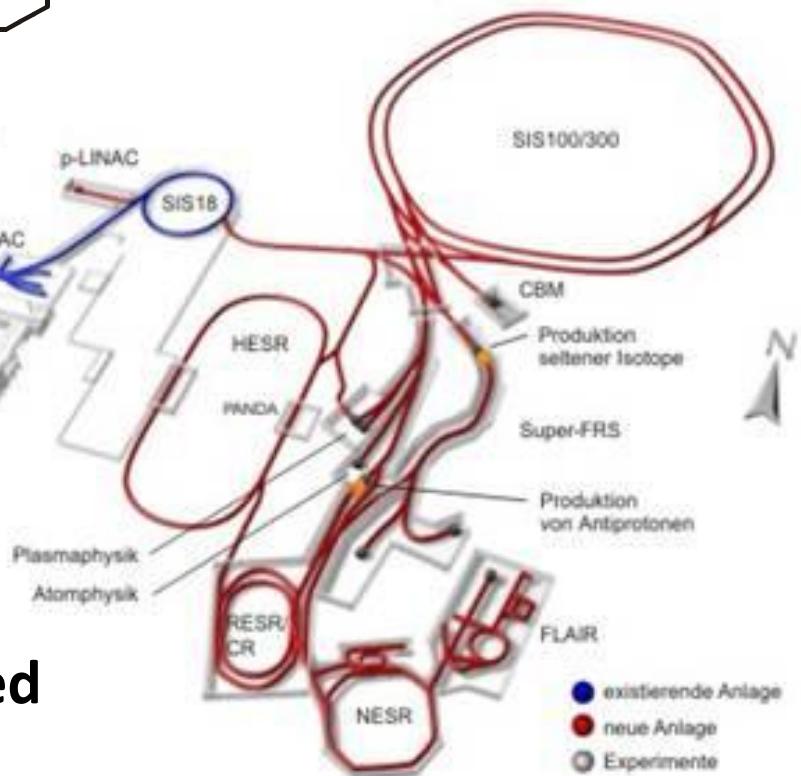

■ Nuclides with known masses  
G.Audi et al., Nucl. Phys. A729 (2003) 3

■ To be measured with SUPER-FRS-CR-RESR-NESR  
Conceptual Design Report, GSI 2001

□ Observed nuclei

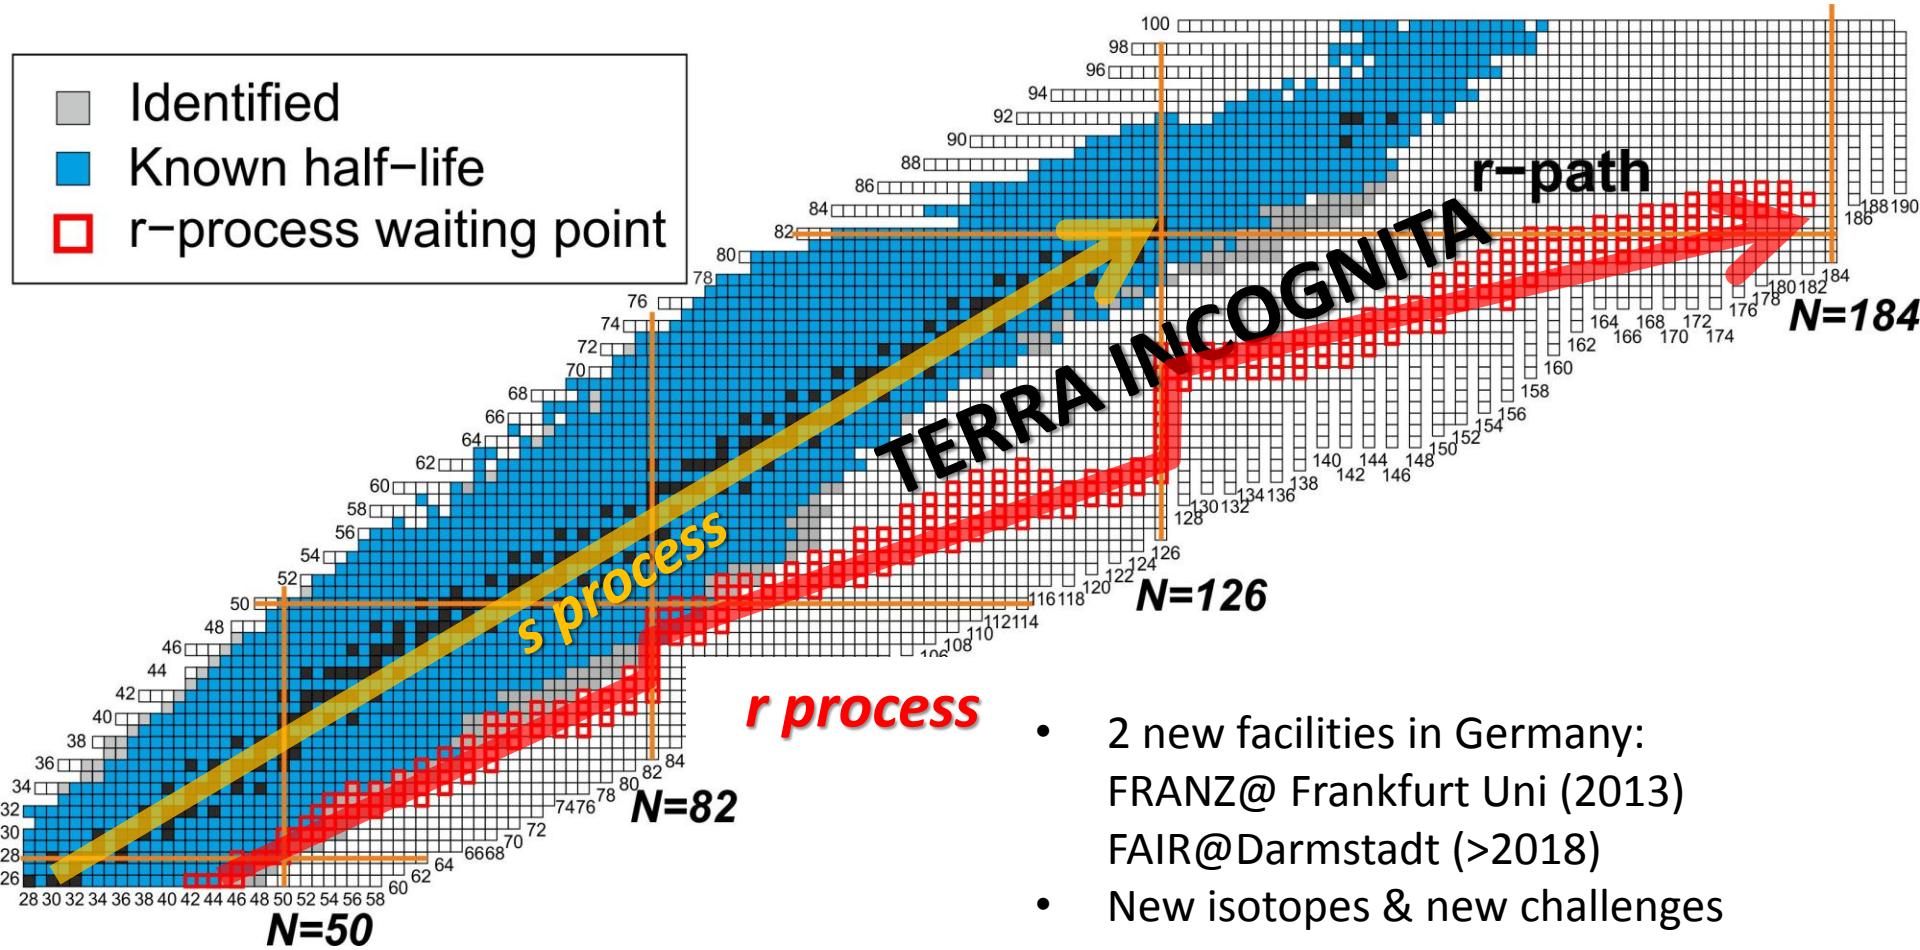

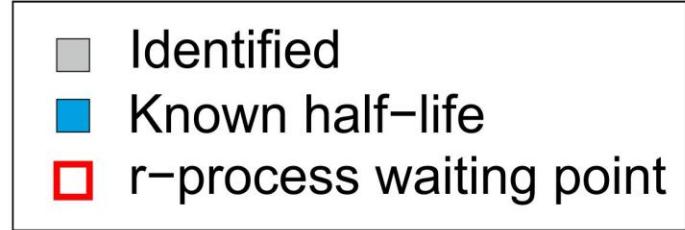

Facility for Antiproton  
and Ion Research

Future RIB facilities: more  $\beta$ xn-emitters in reach, priorities shifted

# Summary: Nuclear Astrophysics with Neutrons

- "rapid" and "slow" neutron capture process

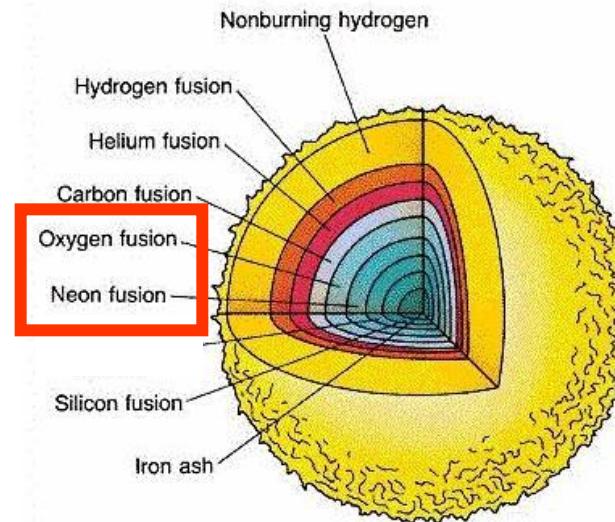

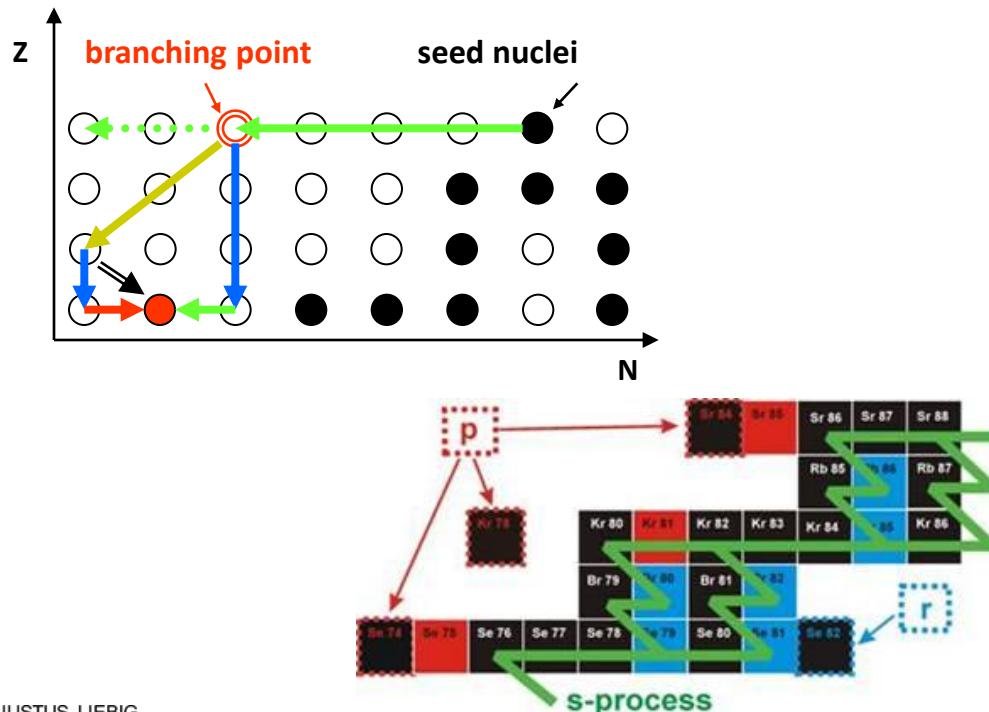

- 2 new facilities in Germany:  
FRANZ@ Frankfurt Uni (2013)  
FAIR@Darmstadt (>2018)
- New isotopes & new challenges

# The „p processes“: To p or not to p

- Superposition of independent processes?  $p = \gamma (+ rp?) + vp + v$
- „ $\gamma$  process“: Expl. O/Ne burning during core collapse SN in massive stars
- Shock front heats shells up to 2-3 GK  $\Rightarrow$  Explosive burning for 1-10 s
- Photodisintegration of pre-existing heavy (s or r) seed nuclei
- Formation of >30 stable isotopes between  $^{74}\text{Se}$  and  $^{196}\text{Hg}$

**~1% of abundances >Fe**
