

## <sup>43</sup>Al

Baumann et al. observed <sup>43</sup>Al in the 2007 paper “Discovery of <sup>40</sup>Mg and <sup>42</sup>Al suggests neutron drip-line slant towards heavier isotopes” (2007Ba71). A 141 MeV/nucleon <sup>48</sup>Ca beam bombarded a natural tungsten target and <sup>40</sup>Mg was identified with the MSU/NSCL A1900 fragment separator and the S800 analysis system. “Further, the 23 events of <sup>42</sup>Al establish its discovery. [The figure] also contains one event consistent with <sup>43</sup>Al.”
