

³⁶Si

Artukh et al. discovered ³⁶Si in the 1971 paper “New isotopes ^{29,30}Mg, ^{31,32,33}Al, ^{33,34,35,36}Si, ^{35,36,37,38}P, ^{39,40}S, and ^{41,42}Cl produced in bombardment of a ²³²Th target with 290 MeV ⁴⁰Ar ions” (1971Ar32). A 290 MeV ⁴⁰Ar beam from the Dubna 310 cm heavy-ion cyclotron bombarded a metallic ²³²Th. Reaction products were separated and identified with a magnetic spectrometer and a surface barrier silicon telescope. “Apart from the nucleides already known, 17 new nucleides, namely: ^{29,30}Mg, ^{31,32,33}Al, ^{33,34,35,36}Si, ^{35,36,37,38}P, ^{39,40}S and ^{41,42}Cl have been reliably detected.”
