

⁹¹As

Bernas et al. reported the observation of ⁹¹As in “Discovery and Cross-Section Measurement of 58 New Fission Products in Projectile-Fission of 750-A MeV ²³⁸U” at GSI in Darmstadt, Germany, in 1997 ([1997Be70](#)). The experimental and analysis procedures were the same as in the 1994 experiment with the only difference being that a beryllium target was used instead of a lead target. “The projectile fission of uranium at relativistic energy impinging on a Be target was investigated with the fragment separator, FRS, in order to produce and identify new isotopes and to measure their production yields.” 37 counts of ⁹¹As were observed.
