^{96}Se

In 2024, Shimizu et al. reported the observation of ^{96}Se in the paper "Production of new neutron-rich isotopes near the N=60 isotones ^{92}Ge and ^{93}As by in-flight fission of a 345 MeV/nucleon ^{238}U beam" (2024Sh17). The beam was provided by the RIBF accelerator complex at RIKEN and the fission fragments were separated and identified with the large-acceptance two-stage separator BigRIPS. "In total, we have produced and identified the following 15 new neutron-rich isotopes: ^{84}Cu, ^{86,87}Zn, ^{88,89}Ga, ^{91,92}Ge, ^{93,94,95}As, ^{96,97}Se, ^{99,100}Br, and ^{103}Kr." 230 events for ^{96}Se were recorded. Preliminary results had been presented earlier in an annual report (2015ShZX).
