

## <sup>70</sup>Kr

Blank et al. reported the discovery of <sup>70</sup>Kr in “New Isotopes From <sup>78</sup>Kr Fragmentation and the Ending Point of the Astrophysical Rapid-Proton-Capture Process” in 1995. They produced the isotopes using SISSI and LISE at the Grand Accélérateur National d’Ions Lourds (GANIL) facility ([1995B106](#)). The discovery was made using projectile fragmentation with <sup>78</sup>Kr at 73 MeV/nucleon on a nickel target. “We obtained clear evidence for the existence of the five new isotopes <sup>60</sup>Ga, <sup>64</sup>As, <sup>69,70</sup>Kr, and <sup>74</sup>Sr.” Identification of the new isotope was achieved using time of flight and ΔE-E measurements and confirmed by measuring γ decays of known isomers.
