

¹²²Rh

¹²²Rh was discovered by Bernas et al. in 1997, as reported in “Discovery and cross-section measurement of 58 new fission products in projectile-fission of 750·A MeV ²³⁸U” ([1997Be70](#)). The experiment was performed using projectile fission of ²³⁸U at 750 MeV/nucleon on a beryllium target at GSI in Germany. “Fission fragments were separated using the fragment separator FRS tuned in an achromatic mode and identified by event-by-event measurements of ΔE -B ρ -ToF and trajectory.” During the experiment, five counts for ¹²²Rh were recorded.
