^{140}Te

In 1994, Bernas et al. published the discovery of ^{140}Te in "Projectile fission at relativistic velocities: a novel and powerful source of neutron-rich isotopes well suited for in-flight isotopic separation" (1994Be24). The isotope was produced using projectile fission of ^{238}U at 750 MeV/nucleon on a lead target at GSI, Germany. "Forward emitted fragments from ^{80}Zn up to ^{155}Ce were analyzed with the Fragment Separator (FRS) and unambiguously identified by their energy-loss and time-of-flight." This experiment yielded 264 counts of ^{140}Te.
