

¹⁵¹La

In 1994, Bernas et al. published the discovery of ¹⁵¹La in “Projectile fission at relativistic velocities: a novel and powerful source of neutron-rich isotopes well suited for in-flight isotopic separation” 1994 ([1994Be24](#)). The isotopes were produced using projectile fission of ²³⁸U at 750 MeV/nucleon on a lead target at GSI, Germany. “Forward emitted fragments from ⁸⁰Zn up to ¹⁵⁵Ce were analyzed with the Fragment Separator (FRS) and unambiguously identified by their energy-loss and time-of-flight.” This experiment yielded 106 counts of ¹⁵¹La.
