

^{120}Pr

Fukuda et al. reported the discovery of ^{120}Pr in the 2026 article “First Observation of Twenty-two Exotic Isotopes Using a ^{208}Pb Primary Beam at RIBF” ([2026Fu06](#)). A 345-MeV/nucleon ^{208}Pb from the RI Beam Factory at RIKEN in Japan, impinged on 2–5 mm thick Be targets and resulting fragments were separated and identified with the large-acceptance two-stage BigRIPS separator. “Five distinct loci observed beyond the boundaries were identified as new proton-rich isotopes: $^{154}_{73}\text{Ta}$ and $^{153,152}_{72}\text{Hf}$ in Fig. [...] and $^{120}_{59}\text{Pr}$ and $^{118}_{58}\text{Ce}$ in Fig. [...].”
