

^{124}Nd

Suzuki et al. discovered ^{124}Nd in “Discovery of Proton-Rich Radioactive Isotopes in the $Z = 60$ Region Produced by the Projectile Fragmentation of a 345-MeV/Nucleon ^{238}U Beam” ([2025Su21](#)). The RI Beam Factory at RIKEN delivered the 345-MeV/Nucleon primary ^{238}U Beam to a 1-mm thick beryllium production target. The fast fragments were separated with the BigRIPS in-flight separator and identified by the measurements of time of flight (TOF), the magnetic rigidities before and after a degrader, and the energy loss. “The new isotopes observed in our present study were 13 nuclides in total: $^{118,119}_{57}\text{La}$, $^{119,120}_{58}\text{Ce}$, $^{122,123}_{59}\text{Pr}$, $^{123,124,126}_{60}\text{Nd}$, $^{125,126,127}_{61}\text{Pm}$, and $^{128}_{62}\text{Sm}$.”
