

## **<sup>143</sup>Pm**

“Promethium isotopes” was published in 1952 by Kistiakowsky documenting the observation of <sup>143</sup>Pm ([1952Ki25](#)). Neodymium oxide enriched in <sup>143</sup>Nd and <sup>144</sup>Nd were bombarded with 8.9 MeV protons from the Berkeley 60-inch cyclotron. Gamma- and beta-ray spectra were measured following chemical separation. “Bombardments of (Nd<sup>143</sup>)<sub>2</sub>O<sub>3</sub> and (Nd<sup>144</sup>)<sub>2</sub>O<sub>3</sub> separately with 8.9 Mev protons both yielded activities with half-lives of 200–400 days, consisting principally of electromagnetic radiation. These activities from the (Pr<sup>141</sup>)<sub>6</sub>O<sub>11</sub>, (Nd<sup>143</sup>)<sub>2</sub>O<sub>3</sub>, and (Nd<sup>144</sup>)<sub>2</sub>O<sub>3</sub> bombardments were examined on a scintillation spectrometer. The conclusions drawn from these measurements were that Pm<sup>143</sup> and Pm<sup>144</sup> are probably very similar in their decay characteristics and that the activity observed from (Pr<sup>141</sup>)<sub>6</sub>O<sub>11</sub> bombardments is probably a mixture due to both of these nuclides.”
