

## $^{132}\text{Sm}$

Wadsworth et al. discovered  $^{132}\text{Sm}$  in 1989 as reported in “Yrast band spectroscopy of  $^{132}\text{Sm}$  and  $^{130}\text{Nd}$ ” (1989Wa21). A  $^{96}\text{Ru}$  target was bombarded with a 195 MeV  $^{40}\text{Ca}$  beam to produce  $^{132}\text{Sm}$  in the fusion-evaporation reaction  $^{96}\text{Ru}(^{40}\text{Ca},2\text{p}2\text{n})$ . Reaction products were separated with the Daresbury recoil separator and  $\gamma$ -rays and neutrons were measured with 10 bismuth germanate suppressed germanium detectors and five NE213 liquid scintillators, respectively. “Transitions in  $^{132}\text{Sm}$  were assigned to  $^{132}\text{Sm}$  by comparison of gamma-ray spectra gated by mass 132 recoils and a single coincident neutron. The identification was helped by a further comparison with a  $2\text{n}-\gamma$  spectrum. This latter spectrum made it possible to distinguish between gamma-rays from  $^{132}\text{Pr}(3\text{pn channel})$  and  $^{132}\text{Sm}(2\text{p}2\text{n})$ .”
