

¹⁵⁷Eu

The observation of ¹⁵⁷Eu by Winsberg was published as part of the Plutonium Project in 1951: “Study of 60m Eu⁽¹⁵⁸⁾ and 15.4h Eu⁽¹⁵⁷⁾ activities in fission” (1950Wi08). Uranyl nitrate was irradiated with neutrons in the thimble of the Argonne Heavy-water Pile. Decay curves and absorption spectra were measured with a thin-windowed Geiger Mueller tube following chemical separation. “The tentative mass assignments of 158 for the 60m Eu and of 157 for the 15.4h Eu was suggested by the fission-yield–mass curve of U²³⁵. Neither isotope has been mentioned in the published literature.”
