

¹⁵⁸Er

¹⁵⁸Er was first observed by Dneprovskii in 1960 as reported in “New isotopes of holmium and erbium” (1960Dn01). Tantalum targets were bombarded with 660 MeV protons from the Dubna synchrocyclotron and ¹⁵⁸Er was populated in spallation reactions. Conversion electrons were measured with a magnetic beta-spectrograph following chemical separation. “From the facts accumulated, we may ascertain the presence of the decay chain $\text{Er} \xrightarrow{2.4\text{hr}} \text{Ho} \xrightarrow{27\text{min}} \text{Dy}$... The position of the first excitation level as a function of neutron number suggests that the mass number of the nuclei belonging to the above decay chain is A=158.”
