

¹⁷⁶Hf

¹⁷⁶Hf were discovered by Aston in “Constitution of hafnium and other elements” in 1934 ([1934As03](#)). The stable isotopes were identified with an anode discharge tube installed at the Cavendish Laboratory mass spectrograph. “Hafnium gives a mass-spectrum indicating five isotopes, a weak line at 176 and four strong ones, 177, 178, 179, 180, of which the even numbers are rather more abundant.”
