

^{176}Ir

In the paper entitled “Alpha-active iridium isotopes”, Siivola described the discovery of ^{176}Ir in 1967 ([1967Si02](#)). The Berkeley Hilac accelerated ^{19}F beams to 105–185 MeV which bombarded enriched targets of ^{162}Er , ^{164}Er , and ^{166}Er . Alpha spectra were measured with a Au-Si surface barrier counter at the end of a continuously operating recoil collection apparatus. Alpha-decay energies and half-lives are listed in a table. The half-life was measured as 8(1) s for ^{176}Ir .
