

## **<sup>209</sup>Po**

Kelly and Segre first observed <sup>209</sup>Po and reported their results in the 1949 paper “Some excitation functions of bismuth” ([1949Ke10](#)). Bismuth targets were bombarded with 19 MeV deuterons from the Berkeley 60-inch cyclotron. Resulting activities were measured with a parallel plate ionization chamber. “The Po<sup>208</sup> activity seemed to be produced by deuterons of an energy too low to make a (d,3n) reaction. A further close examination of the alpha-activity in the energy region between 10 and 15 Mev showed that we had also another Po isotope present, emitting alphas of 4.95 Mev. This substance is Po<sup>209</sup> formed by the (d,2n) reaction. If we assume that it decays only by  $\alpha$ -emission and that the maximum cross section for its formation is about  $10^{-24}$  cm<sup>2</sup>, a half-life of about 200 years results.”
