

## **<sup>240</sup>Pu**

In 1949, James et al. identified <sup>240</sup>Pu in “Products of helium-ion and deuteron bombardment of U<sup>235</sup> and U<sup>238</sup>” (1949Ja01). Natural uranium and <sup>238</sup>U targets were bombarded with 32 MeV  $\alpha$  particles from the Berkeley 66-inch cyclotron forming <sup>240</sup>Pu in the ( $\alpha$ ,2n) reaction. X-rays,  $\gamma$ -rays and  $\alpha$  particles were measured following chemical separation. “It was therefore concluded that this excess of  $\alpha$  particles was due to Pu<sup>240</sup>, which emits  $\alpha$  particles with an energy very close to but slightly less than those of Pu<sup>239</sup>. On the basis of this broadening, the range was taken as 3.60 cm of air; and from the yield of these  $\alpha$  particles the half life of Pu<sup>240</sup> was estimated to be approximately 6,000 years.” James et al. credited a private communication by Chamberlain, Farwell and Segrè with the first observation of <sup>240</sup>Pu.
