ATOMIC ENERGY OF CANADA LIMITED

FEW GROUP CROSS SECTIONS FOR 274 NUCLIDES
BASED ON ENDF/B V

by

M.S. Milgram, S. Thompson and R. Paulson*

ABSTRACT

Thermal and epithermal Westcott parameters g , g_e , and s have been calculated for 274 nuclides at four physical temperatures using ENDF/B-V as the data source. Calculated cross sections and parameters are listed in the text or in microfiche appendices.

FEW GROUP CROSS SECTIONS FOR 274 NUCLIDES
BASED ON ENDF/B V

by

M.S. Milgram, S. Thompson and R. Paulson*

1. INTRODUCTION

In the analysis of thermal reactors, it is convenient to represent the energy dependent reaction cross section for a particular nuclide by few group parameters. In the thermal ($E < 1$ eV) and epithermal (1 eV $< E < 1$ MeV) regimes, it is convenient to use the Westcott (1) representation. In the fast regime, ($E > 1$ MeV) the usual approximation involves weighting the energy dependent cross section with a fission spectrum and averaging over the energy range of interest. In reactor codes such as SOLACE (2) and LATREP (3), the energy range is compacted into several groups - one thermal, and 46 epithermal groups, so reaction cross sections for each of these groups must be available.

Accordingly, we have calculated group parameters for materials of interest using the ENDF/B V library as a data base. From this multigroup library we have further calculated both Westcott and fixed cut-off thermal representations as well as fast cross sections. Future versions of SOLACE will be available with a (thermal group) data library based on this compilation; it is the purpose of this report to summarize the epithermal and thermal Westcott parametrizations independent of reference to any particular lattice code.

In Section 2, we briefly review the thermal cross section representations and, in Section 3, for completeness we define a fast group representation. Section 4 contains a brief description of the methodology used, and Section 5 gives a summary of the more significant results. Since many of the calculations are of more general interest than solely for application in SOLACE, a microfiche addendum is provided which contains a more complete set of results. This is discussed in Section 5 in more detail.

2. THERMAL REPRESENTATION

The derivation of Westcott and fixed cut-off representations for thermal cross sections is described in reference 1 and 2, and is summarized here for completeness' sake.

* Waterloo Student, 1982, 1983

A. Westcott Representation

Westcott assumes that the energy dependent neutron flux $\phi(E)$ can be written as the sum

$$\phi(E) = \phi_m(E) + \phi_e(E) \quad (2.1)$$

where $\phi_m(E)$, the Maxwellian flux characterized by a neutron temperature T is of the form

$$\phi_m(E) = \phi_w \sqrt{\frac{4T}{\pi T_0}} (1-f) E e^{-E/kT} / (kT)^2 \quad (2.2)$$

and ϕ_e , the epithermal flux is written

$$\phi_e = \frac{\phi_w f}{b} \sqrt{\frac{4T}{\pi T_0}} \frac{\Delta_4(E, T)}{E} \quad (2.3)$$

Here we have set the normalizing Westcott flux

$$\phi_w = N v_0 \quad (2.4)$$

where N is the total neutron density, $v_0 = 2200 \text{ m} \cdot \text{s}^{-1}$, $T_0 = 293.6 \text{ K}$ is the corresponding neutron temperature, and k is Boltzmann's constant. Additionally, f is the fraction of neutrons in the $\phi_e(E)$ distribution and $b=1.1763$ is defined in terms of Westcott's joining function $\Delta_4(E, T)$ by

$$\int_0^\infty \frac{\Delta_4(E, T)}{E^{3/2}} dE = 2/(\mu kT)^{1/2} \quad (2.4)$$

together with

$$b = 4/(\mu \pi)^{1/2} \quad (2.5)$$

It is worth noting that although Δ_4 is a function of both E and T , the integral (2.4) has the form given for all T (so μ is a constant), it approximates the shape of the physical joining spectrum in thermal lattices, and has a cut-off at energy μkT . Figure 1 illustrates $\Delta_4(E, T)$ as a function of E for various values of T . According to Westcott (1), an analytic form for Δ_4 is

$$\Delta_4 = \{1 - .26/(1 + (E/16.4 kT)^5) + (4.75 kT/E)^7\}^{-1} \quad (2.6)$$

In order to calculate reaction rates from an energy-dependent cross section $\sigma(E)$, we need the so-called Westcott cross section $\hat{\sigma}$ parametrized by

$$\hat{\sigma} = \sigma_0^o (g(T) + rs(T)) \quad (2.7)$$

where σ_0^o is the $2200 \text{ m}\cdot\text{s}^{-1}$ microscopic cross section, the Westcott epithermal index r^o is given by

$$r = f/b \quad (2.8)$$

and the temperature dependent integrals $g(T)$ and $s(T)$ are calculated from

$$g(T) = \frac{2}{\sigma_0^o} (E_0^o \pi)^{-1/2} (kT)^{-3/2} \int_0^\infty \sigma(E) E \exp(-E/kT) dE \quad (2.9)$$

and

$$s(T) = \frac{1}{\sigma_0^o} \sqrt{\frac{4T}{\pi T_0^o}} \int_0^{E_2} \frac{\sigma(E) \Delta_4(E, T)}{E} dE - bg(T) \quad (2.10)$$

Here we use $E_0^o = kT_0^o$ and E_2 is a cut-off representing the high end of the epithermal energy range. The reaction rate (per nucleus) below energy E_2 is then given by

$$\text{Reaction Rate} = \hat{\sigma} \phi_w \quad (2.11)$$

Remember that in the case where σ is proportional to $1/v$ we find $s=0$ and $g=1$.

B. Fixed cut-off Representation

In contrast to the Westcott temperature dependent cut-off μkT , it is convenient to define a fixed cut off energy E_1 which is customarily fixed at 0.625 eV. The sub-cut off flux is related to the Westcott flux by

$$\sigma_{sc} = \phi_w \sqrt{\frac{4T}{\pi T_0^o}} (1-f+f\xi(T)) \quad (2.12)$$

and the epi-cut-off (= above cut-off) flux is given by

$$\phi_e = \phi_w f \chi(T) \quad (2.13)$$

where $\xi(T)$ and $\chi(T)$ are (neutron) temperature dependent functions defined by

$$\xi(T) = b \int_0^{E_1} \Delta_4(E, T)/E dE \quad (2.14)$$

and

$$\chi(T) = 1/2 \sqrt{\mu k T} \int_{E_1}^{E_2} \Delta_4(E, t)/E^{3/2} dE \quad (2.15)$$

The sub-cut-off cross section σ_{sc} is then given by

$$\hat{\sigma}_{sc} = \sigma_0 \sqrt{\frac{\pi T_0}{4T}} \left\{ \frac{g(T) + f(g_e(T) - g(T))}{1 - f(1 - \xi(T))} \right\} \quad (2.16)$$

and the epi-cut-off cross section $\hat{\sigma}_e$ is

$$\hat{\sigma}_e = \frac{\sigma_0}{f\chi(T)} \{ f(g(T) - g_e(T)) + r s(T) \} \quad (2.17)$$

Here we have introduced the new cut-off parametrization

$$g_e(T) = \sqrt{\frac{\mu T}{4T_0}} \frac{1}{\sigma_0} \int_0^{E_1} \frac{\Delta_4(E, t)\sigma(E)}{E} dE \quad (2.18)$$

The total reaction rate (per nucleus) below energy E_2 is thus

$$\text{Reaction Rate} = \hat{\sigma}_e \phi_e + \hat{\sigma}_{sc} \phi_{sc} \quad (2.19)$$

From the above considerations it is possible to derive an alternate form for $s(T)$, given by

$$s(T) = I(T) + b(g_e(T) - g(T)) \quad (2.20)$$

where

$$I(T) = \sqrt{\frac{4T}{\pi T_0}} \frac{1}{\sigma_0} \int_{E_1}^{E_2} \frac{\sigma(E)\Delta_4(E, T)}{E} dE \quad (2.21)$$

Recall that the resonance integral is usually defined by

$$RI = \int_{E_L}^{E_H} \frac{\sigma(E)dE}{E} . \quad (2.22)$$

A second useful result for a substance with a $1/v$ cross-sectional dependence

$$(\sigma(E) = \sigma_0 (E/E_0)^{1/2}) \text{ is}$$

$$g_e(T) = 1. - \chi(T)$$

which simplifies computation when it is valid.

3. FAST GROUP REPRESENTATION

For energies greater than about 1 MeV, a reasonable approximation is to assume that the energy dependent flux shape is that of a fission spectrum approximated by

with $S_f(E) = \sqrt{E} \exp(-E/\theta)$ (3.1)

$$\theta = 1.382 \text{ MeV for } U^{233}$$

$$1.354 \text{ " for } U^{235}$$

$$1.408 \text{ " for } Pu^{239}$$

An approximate representation for the fast group cross section is then

$$\hat{\sigma}_f = \frac{\int_{E_2}^{E_3} S_f(E) \sigma(E) dE}{\int_{E_2}^{E_3} S_f(E) dE} \quad (3.2)$$

4. METHODOLOGY

The overriding consideration has been that of automation - i.e. consistent reduction of ENDF/B data to the desired form for all materials and reaction types with a minimum of intervention or evaluation. Accordingly, the data for each material was processed by the same sequence of codes with the same parameters and error criterion.

For each material, a sequence of consecutive computer jobs was initiated, each of which employed a different module of the NJOY code (5), to process or add to the output from the previous job step. The sequence (and corresponding NJOY module) is as follows for each material (6).

- 1) Create a pointwise energy dependent representation, Doppler broadened to one of four physical temperatures (BROADR, RECONR, UNRESR);

- 2) calculate multigroup cross sections using appropriate (neutron temperature dependent) weighting functions for 69 energy groups at each physical temperature, and for all reaction types available for each material (GROUPR);
- 3) sort the results, uniting scattering matrices with the other reaction types calculated at that energy and temperature (DTFR); and
- 4) store the final results as part of the random access multi-group nuclear data library - NUBILE (7).

Several utility programs have been written to process the NUBILE library file. To calculate any of the few group parameters listed herein, for any reaction type, we sum the appropriate multigroup cross sections σ_i with appropriate weighting; e.g.

$$g(T) = \frac{2 E_1}{\sigma_0 \pi} (E_0 kT)^{-1/2} e^{-E_1/kT} \sum_{i=1}^{24} \overline{\phi}_i \sigma_i$$

$$g_e = \sqrt{\frac{T}{4T_0}} \frac{1}{\sigma_0} \sum_{i=1}^{24} \sigma_i \overline{\Delta}_4^i$$

$$I = \sum_{i=25}^{64} \sigma_i \overline{\Delta}_4^i$$

$$\text{where } \overline{\phi}_i = \int_{E_i}^{E_{i+1}} \phi(E, T) dE$$

$$\text{and } \overline{\Delta}_4^i = \int_{E_i}^{E_{i+1}} \Delta_4(E, T) dE$$

To obtain $s(T)$ use Eq.(2.20)

In addition polynomial fits to each of the above parameters are available as a function of neutron temperature, at each of the four different physical temperatures. These form a basic part of the SOLACE data library.

5. RESULTS

The processing described in Section 4 was applied to 274 materials from ENDF/B V, listed in Table 1 by their common name, ENDF/B material number identifier, and ZA numbers ($^{94}_{\text{Pu}}{}^{240}$ has ZA = 94240).

Reaction cross sections for each of the parameters σ_o , g, g_e and s are listed in Appendix A, at a physical temperature of 0°K . We define

$$\text{absorption} = (n,\gamma) + (n,f) + (n,d) + (n,p) + (n,\alpha) + \dots \quad (\text{omit scatter})$$

$$\text{total} \quad = \text{absorption} + \text{scatter}$$

To define the group boundaries discussed in Section 2 and 3 we have used

$$E_1 = 0.625 \text{ eV corresponding to the upper limit of group 24}$$

$$E_2 = 0.821 \text{ MeV corresponding to the upper limit of group 64}$$

$$E_3 = 20 \text{ MeV}$$

In the microfiche appendix we list the same parameters as in Appendix A at three (broadened) values of the physical temperature (300 K , 700 K , 1100 K). For each material, the parameters are listed at any of the three higher temperatures only if the ratio of at least one value to that of the corresponding value at 0°K differs by more than one part in 1000. Table 2 is an index to the microfiche addendum.

APPENDIX A: NOTE

The following ENDF/B-V materials are omitted from this Appendix because they could not be processed by NJOY for reasons that remain unclear:

CA-NAT	W182
Hf 176	W184
W-NAT	W185

The following material was omitted because it is believed to be substantially in error: (8)

Lu 176

In addition, the following material is included but is suspected to contain errors:
