

$^{99}\text{Ru}(^3\text{He},2n\gamma)$  2009Ra06

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh and Jun Chen		NDS 172, 1 (2021)	31-Jan-2021

2009Ra06: E=17 MeV beam was supplied by the FM Tandem Van de Graaff, at the University of Cologne. The  $^{99}\text{Ru}$  target was 0.8 mg/cm<sup>2</sup> thick backed on 15 mg/cm<sup>2</sup>  $^{197}\text{Au}$  substrate. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma\gamma$ -coin,  $\gamma\gamma(\theta)$  using HORUS cube array of 12 HPGe detectors, five of which were (BGO) Compton suppressed. Deduced levels, J,  $\pi$ ,  $\gamma$ -ray multipolarities, mixing ratios. Comparison with theoretical calculations using shell model ANTOINE code. All data are from 2009Ra06, unless otherwise noted.

 $^{100}\text{Pd}$  Levels

The 1523.6, 2621.6 and 2679.2 levels reported earlier were not confirmed in the work by 2009Ra06, due to different placements (for the first two levels) or non-observation (for the third level) of the de-exciting transitions.

E(level) <sup>†</sup>	J $\pi^{\ddagger}$	Comments
0.0	0 <sup>+</sup>	
665.4 2	2 <sup>+</sup>	
1415.9 2	4 <sup>+</sup>	
1587.4 2	2 <sup>+</sup> #	Identified as a 2-phonon state.
1925.4 2	3 <sup>+</sup> #	Possible 3-phonon state.
2055.4 3	(4 <sup>-</sup> )	
2189.0 3	6 <sup>+</sup>	
2278.0 3	5 <sup>+</sup> #	
2351.0 4	(4 <sup>+</sup> )	
2358.8 5	(2) <sup>+</sup>	Identified as one-phonon mixed-symmetry state. J $\pi$ : tentative assignment from $\gamma\gamma(\theta)$ data (2009Ra06).
2430.2 4	4 <sup>#</sup>

<sup>†</sup> From **2009Ra06** based on  $\gamma\gamma(\theta)$  data. The  $A_2$  and  $A_4$  angular distribution coefficients are not listed by the authors, but detailed angular correlation plots are given. Authors discuss specific multipolarity assignments for a few transitions in the text, others are implied by the evaluators from  $J^\pi$  values of the initial and final levels. As the angular distribution are parity insensitive, evaluators assign D+Q and Q for implied M1+E2 and E2 from  $\Delta J^\pi$  values, however for large  $\delta(\text{Q/D})$  values, (M1+E2) is assigned from RUL, assuming that there are no levels with half-lives longer than few ns.

<sup>‡</sup> Placement of transition in the level scheme is uncertain.
