 $\gamma(^{103}\text{Ru})$

I γ normalization: for $I(\gamma+\text{ce})(210.7\gamma)+I(\gamma+\text{ce})(213.4\gamma)=100$ per 100 IT decays. Uncertainty assigned by the evaluator.

[‡] For absolute intensity per 100 decays, multiply by 0.91 15.

[#] Total theoretical internal conversion coefficients, calculated using the Brllcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.
