^{107}Tc β^- decay (21.2 s) [1979St24](#), [1989Gr23](#) (continued)

$\gamma(^{107}\text{Ru})$ (continued)

† E_γ , I_γ are from γ singles ([1979St24](#)), except for complex peaks which are evaluated via $\gamma\gamma$ coin.

‡ The E_γ and the I_γ are from $\gamma\gamma$ ([1979St24](#)).

Estimated by [1979St24](#) from intensity balance arguments using I_γ data from $\gamma\gamma$.

@ For absolute intensity per 100 decays, multiply by 1.0 *I*.

& Total theoretical internal conversion coefficients, calculated using the BrIcc code ([2008Ki07](#)) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

^x γ ray not placed in level scheme.
