

(HI,xn γ) **1997Ju01,1997JeZZ,1996Wa12**

Type	Author	Citation	History Literature Cutoff Date
Full Evaluation	Jean Blachot	ENSDF	1-Jul-2008

1997Ju01: $^{54}\text{Fe}(^{58}\text{Ni},4\text{p}\gamma)$ E=270 MeV. Measured E γ , I γ , $\gamma\gamma$, DSA Enriched ^{54}Fe target, Ge, BGO suppression shields. Nordball detector particle selection.

1997JeZZ: $^{54}\text{Fe}(^{58}\text{Ni},4\text{p}\gamma)$ E=243 MeV. Measured E γ , I γ , $\gamma\gamma$, DSA Enriched ^{54}Fe target, Ge, BGO suppression shields, Same group as **1993Wa13** and **1996Wa12** with better statistic. Gammasphere detector with 95 HPGe detectors but no particle selection.

1996Wa12: $^{54}\text{Fe}(^{58}\text{Ni},4\text{p}\gamma)$ E=243 MeV. Measured E γ , I γ , $\gamma\gamma$, DSA Enriched ^{54}Fe target, Ge, BGO suppression shields, Same group as **1993Wa13** with better statistic. Gammasphere detector + Chalk River detector.

1993Wa13: $^{54}\text{Fe}(^{58}\text{Ni},4\text{p}\gamma)$ E=243 MeV. Measured E γ , I γ , $\gamma\gamma$, DSA, Enriched ^{54}Fe target, Ge, BGO suppression shields. Chalk River detector.

1989Az02: $^{54}\text{Fe}(^{58}\text{Ni},4\text{p}\gamma)$ E= 268 MeV. Measured E γ , I γ , $\gamma\gamma$. Enriched ^{54}Fe target ($700\mu\text{g}/\text{cm}^2$) French multidetector system "Chateau de Cristal" consisting of 38 BaF₂ and 12 hyper-pure Ge detectors used with anti-Compton shields. Sixty million events were recorded on tape and analyzed. The maximum yield of ^{108}Sn was found in the window of lowest total energy. X-ray coincidences are used to distinguish ^{109}Sb and ^{107}In . $\gamma\gamma(\theta)$ and linear polarization were also measured.

1981An06: $^{92}\text{Mo}(^{19}\text{F},\text{p}2\text{n}\gamma)$ E=65– 89 MeV. Measured E γ , I γ , $\gamma\gamma$, $\gamma(\theta)$, $\sigma(E)$, δ .

1980Au08: $^{58}\text{Ni}(^{54}\text{Fe},4\text{p}\gamma)$ E= 290 MeV. Measured E γ , I γ , $\gamma\gamma$, $\sigma(E)$.

1979ChYZ: $^{58}\text{Ni}(^{54}\text{Fe},4\text{p}\gamma)$ E= 290 MeV, 230 MeV. Measured E γ , I γ , $\gamma\gamma$.

1969InZZ: $^{100}\text{Ru}(^{12}\text{C},4\text{n}\gamma)$ E=70– 95 MeV. They found the 2⁺, 4⁺, and 6⁺ levels.

The level scheme is mainly that of **1997Ju01** with some modifications and new bands proposed by **1997JeZZ**. Negative parity band above the 19⁻ level at 10053 and the positive parity band above the 20⁺ level at 9908 are from **1996Wa12**, also the unlinked band is from **1996Wa12** with E γ from **1997JeZZ**. **1989Az02** agree until the 22⁺ in g.s. band and for levels below 6500 keV. **1980Au08** report a preliminary level scheme with an inversion in the order of the 616 and 1141 transitions.
