Beam: $^{58}\text{Ni}=270$ MeV. Target: ^{54}Fe , 10 mg/cm² thick, enriched to 99.8%. The ^{58}Ni beam was provided by the accelerator facilities of the Tandem Accelerator Laboratory of the Niels Bohr Institute in Denmark. γ -rays were detected by the NORDBALL multi-detector array, consisting of 15 BGO shielded Ge detectors, one of which was a LEPS detector. In order to select different reaction channels a 4π charged-particle detector system comprising 21 ΔE -type Si detectors, a 1π neutron-detector assembly consisting of 11 liquid scintillator detectors in the forward direction, and a 2π γ -ray calorimeter composed of 30 BaF₂ crystals in the forward hemisphere were used.

Measured: $E\gamma$, $I\gamma$, $\gamma\gamma$, $\gamma\gamma(\theta)$. Deduced: ^{110}Te levels, J^π .

‡ Relative intensity deduced from a spectrum gated on 744.7 γ from the sum of the 1p and 2p gated matrices.

From the deduced correlation ratio $R=I_\gamma(\approx 143^\circ)/I_\gamma(\approx 79^\circ, \approx 101^\circ)$ using $\gamma\gamma(\theta)$ in 1994Fa12 and the apparent band structure.
