Q(β^-)=12210 *SY*; S(n)=2740 *SY*; S(p)=17670 *CA*; Q(α)=−11700 *CA*   2012Wa38,1997Mo25
Estimated uncertainties (2012Wa38): 640 for Q(β^-), 710 for S(n).
Q(β^-) and S(n) from 2012Wa38; S(p) and Q(α) from 1997Mo25.
Q(β^-n)=7210 *580*, S(2n)=7560 *640* (syst,2012Wa38). S(2p)=33520 (1997Mo25,theory).
2010Oh02: ^{117}Mo nuclide identified in Be(^{238}U,F) and Pb(^{238}U,F) reactions with a ^{238}U^{86+} beam energy of 345 MeV/nucleon
    produced by the cascade operation of the RBIF accelerator complex of the linear accelerator RILAC and four cyclotrons RRC, fRC,
    IRC and SRC. Identification of ^{117}Mo nuclei was made on the basis of magnetic rigidity, time-of-flight and energy loss of the
    fragments using BigRIPS fragment separator. Experiments performed at RIKEN facility. Based on A/Q spectrum and Z versus A/Q
    plot, 78 counts were assigned to ^{117}Mo isotope. (Q=charge state).
2015Lo04: ^{117}Mo nuclide produced at RIBF-RIKEN facility in ^{9}Be(^{238}U,F) reaction at E=345 MeV/nucleon with an average
    intensity of 6×10^{10} ions/s. Identification of ^{117}Mo was made by determining atomic Z and mass-to-charge ratio A/Q, where
    Q=charge state of the ions. The selectivity of ions was based on magnetic rigidity, time-of-flight and energy loss. The separated
    nuclei were implanted at a rate of 50 ions/s in a stack of eight double-sided silicon-strip detector (WAS3ABi), surrounded by
    EURICA array of 84 HPGe detectors. Correlations were recorded between the implanted ions and β rays. The half-life of ^{117}Mo
    isotope was measured from the correlated ion-β decay curves and maximum likelihood analysis technique as described in
    2014Xu07. Comparison of measured half-lives with FRDM+QRPA, KTUY+GT2 and DF3+CQRPA theoretical calculations.

^{117}Mo Levels

E(level)	$T_{1/2}$	Comments
0	22 ms *5*	%β^-=?; %β^-n=?; %β^-2n=?
		Theoretical $T_{1/2}$=42.9 ms, %β^-n=16.8, %β^-2n=0.32 (2003Mo09).
		Measured σ=4 pb (2010Oh02), systematic uncertainty≈40%.
		$T_{1/2}$: measured by 2015Lo04 from (implanted ions)β correlated curves in time and position using maximum
		likelihood method. See 2015Lo04 for comparison of their experimental value with theoretical values.
		Probability of misidentification of ^{117}Mo isotope<0.001% (2010Oh02).
