1994To05, 1992JuZX: ⁹²Mo(³²S,α2pnγ) E(³²S)= 145 MeV.

Measured: γγ, Nordball system with 15 Compton-suppressed Ge detectors and a Si detector inner ball. Coin with evaporated charged particles.

1995Li22: ⁹²Mo(²⁸Si,xnγ) E(²⁸Si)=100– 120 MeV.

Measured: γγ, array with 7 Compton-suppressed Ge detectors + 14 elements BGO crystal ball serving as a multiplicity filter.

The level scheme is from 1994To05. 1995Li22 agree up to 39/2⁻ for the band A, up to 27/2⁺ for the band C. They propose three other bands. The gammas of their band 4 are given in 1994To05, but 1994To05 has two levels around 2183 keV (21/2⁺) and the 627γ don't deexcite the same level as the 967γ. The three first levels of the band 2 of 1995Li22 are also given by 1994To05 (band C).
