

$^{58}\text{Ni}(^{64}\text{Zn},3\text{p}\gamma)$ 2021Zh57

Type	Author	Citation	History Literature Cutoff Date
Full Evaluation	Balraj Singh	ENSDF	07-Jan-2022

All γ -ray and level data are from [2021Zh57](#).

[2021Zh57](#): $E(^{64}\text{Zn})=255$ MeV; measured $E\gamma$, $I\gamma$, (recoils) $\gamma\gamma$ -coin, $\gamma\gamma\gamma$ -coin, $\gamma(\theta)$, $\gamma\gamma(\theta)$ (DCO), $\gamma\gamma$ (angular anisotropy), $\gamma\gamma$ (linear polarization), half-life of the 7^+ isomer by $\gamma\gamma(t)$ using JUROGAM 3 array for γ detection and recoil mass separator MARA at the K130 cyclotron of University of Jyvaskyla. Deduced high-spin levels, J^π , multipolarities, multipole mixing ratios, rotational bands, alignments, moments of inertia plots, two-quasiparticle Nilsson configurations, moment of inertia plots. Calculated single-particle Routhians, and moments of inertia plots using particle number conserving cranked shell model (PNC-CSM).

Comparison between experimental results and theoretical model calculations.

Others:

[1997Sm04](#): $^{58}\text{Ni}(^{64}\text{Zn},3\text{p}\gamma)$, $E(^{64}\text{Zn})=265$ MeV and $^{64}\text{Ni}(^{58}\text{Ni},\text{p}3\gamma)$ with incident beams from LBNL cyclotron facility.

Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, $\gamma\gamma(\theta)$ using Gammasphere array with 56 Compton-suppressed HPGe detectors. Proposed signature partners of $\pi h_{11/2} \otimes \nu h_{11/2}$ configuration up to 35^+ , and two short side bands, one with a γ cascade of four transitions, and the other with only two γ transitions. Results in this work are in general agreement with those from [2021Zh57](#), but major differences exist in J^π assignments, as well as γ cascades above $J^\pi \approx 30^+$. The data in this work were provided only as $E\gamma$ values and γ -cascades in a level-scheme figure.

[1993Be46](#): $^{64}\text{Ni}(^{58}\text{Ni},3\text{p}\gamma)$, $E=212$ MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, (recoils) γ -coin using GASP array and recoil-mass spectrometer at XTU Tandem of LNL-Legnaro. Proposed a negative-parity band in ^{118}Cs , based on $\pi h_{11/2} \otimes \nu g_{9/2}$ multiplet, starting from (7^-) to (24^-) up to 35^+ , and a short side band with only two γ transitions. The data in this work were provided only as $E\gamma$ values and γ -cascades in a level-scheme Fig. 3. Experiments by [1994Ka39](#) on the high-spin structure of ^{118}I discovered that the band assigned to ^{118}Cs in [1993Be46](#), actually belonged to ^{118}I , this observation and assertion later confirmed in experiments by [1997Sm04](#) on the high-spin structure of ^{118}Cs .

 ^{118}Cs Levels

E(level) ^a	J^π ^b	T _{1/2}	Comments
0.0 ^m	$2^{(-)}$	14 s 2	J^π : spin from the Adopted Levels, parity proposed by 2021Zh57 . T _{1/2} : from the Adopted Levels.
0.0+x ^c	(7^-)	17 s 3	E(level): 2021Zh57 associated this level with the long-lived isomer. See Adopted Levels for half-life and other comments. T _{1/2} : from the Adopted Levels.
0.0+y ^e	(6^+)		
42.7 ⁿ 3	(3^-)		
64.6+x? 4	$(5,6)$		E(level): since ordering of the $64.7\gamma \rightarrow 61.4\gamma$ cascade is not established (2021Zh57), level energy is either $61.4+x$ or $64.7+x$. In this dataset, ordering is as shown in Figs. 1 and 3 of 2021Zh57 , while it is listed as reversed in authors' Table I.
65.9 ⁱ 5	(3^-)		
79.3+x? 4	$(5,6)$		E(level): since ordering of the $46.3\gamma \rightarrow 79.0\gamma$ cascade is not established (2021Zh57), level energy is either $79.0+x$ or $46.3+x$.
79.6 ^m 4	(4^-)		
117.1 ^o 4	(4^-)		
125.9+x 4	(7^+)	0.55 μs 6	%IT=100 T _{1/2} : from $(79.0\gamma+126.0\gamma)(200.1\gamma)(t)$ (2021Zh57).
128.5 ^j 6	(4^-)		
144.9 ^k 6	(4^-)		
167.8 ⁿ 4	(5^-)		
182.94+x ^d 25	(8^-)		
192.92+y ^f 25	(7^+)		
195.2+x [#] 5	(8^+)		E(level): expected to be an isomer of few ns, as missing intensity from this state could not be accounted (2021Zh57).
217.6 ⁱ 7	(5^-)

[†] From least-squares fit to E γ data. Low value of 0.56 for reduced χ^2 , and only 11 γ rays deviating by 1-2 σ from the fitted values, suggests that uncertainties may be overestimated.

[‡] As proposed by [2021Zh57](#), based on multipolarity assignments and rotational band structures. Exceptions are noted.

[#] Band(A): Band #1, $\pi h_{11/2} \otimes v h_{11/2}, \alpha=0$. Proposed configuration= $\pi 3/2[541] \otimes v 5/2[532]$ from alignment of $\approx 7\hbar$ ([2021Zh57](#)), as also in [1997Sm04](#). The alignment increases to $\hbar\omega \approx 0.5$ MeV with gains of $\approx 2\hbar$ and $\approx \hbar$ in the $\alpha=1$ and $\alpha=0$ signature partners, respectively, and attributed to pair of $h_{11/2}$ protons. This band was reported by [1997Sm04](#) from 10^+ to 35^+ , with both signature partners, and two cascades of 11 transitions in each. The γ -ray cascades in [2021Zh57](#) and [1997Sm04](#) are in good agreement, except that J^π values of the bandheads are two units lower in [2021Zh57](#), and [1997Sm04](#) have one additional γ transition of 1408 keV at the top for $\alpha=0$ signature, and two additional transitions of 1167 keV and a tentative 1346 keV in $\alpha=1$ signature above (25^+) .

[@] Band(a): Band #1, $\pi h_{11/2} \otimes v h_{11/2}, \alpha=1$. Proposed configuration= $\pi 3/2[541] \otimes v 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

[&] Band(B): Side band (or forking) of band #1. This band was reported by [1997Sm04](#), with $1296\gamma \rightarrow 1219\gamma \rightarrow 1221\gamma$ cascade, whereas the cascade is $1296\gamma \rightarrow 1221\gamma \rightarrow 1281\gamma$ in [2021Zh57](#).

^a Band(c): Band #2, $\alpha=1$. Proposed configuration= $\pi 3/2[541] \otimes v 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^b Band(C): Band #2, $\alpha=0$. Proposed configuration= $\pi 3/2[541] \otimes v 5/2[532]$ with similar alignments as for Band #1 ([2021Zh57](#)). The $\alpha=1$ signature partner of this band was reported by [1997Sm04](#) from 15^+ to 23^+ , with a cascade of four γ transitions.

^c Band(d): Band #3, $\alpha=1$. Proposed configuration= $\pi g_{9/2} 9/2[404] \otimes v h_{11/2} 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^d Band(D): Band #3, $\alpha=0$. Proposed configuration= $\pi g_{9/2} 9/2[404] \otimes v h_{11/2} 5/2[532]$ from alignment of $\approx 2.5\hbar$ at low frequency, with alignment gain of $\approx 8\hbar$ at $\hbar\omega \approx 0.35$ MeV ([2021Zh57](#)) due to pair of $h_{11/2}$ protons.

^e Band(E): Band #4, $\alpha=0$. Proposed configurations= $\pi g_{9/2} 9/2[404] \otimes v g_{7/2} 3/2[411]$ from alignment of $\hbar\omega \approx 0.35$ MeV, and from PNC-CSM calculations ([2021Zh57](#)).

$^{58}\text{Ni}(^{64}\text{Zn},3\text{p}\gamma)$ [2021Zh57](#) (continued)

^{118}Cs Levels (continued)

^f Band(e): Band #4, $\alpha=1$. Proposed configurations= $\pi g_{9/2} 9/2[404] \otimes v g_{7/2} 3/2[411]$ or $\pi g_{9/2} 3/2[422] \otimes v d_{5/2} 5/2[413]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^g Band(f): Band #5, $\alpha=1$.

^h Band(F): Band #5, $\alpha=0$.

ⁱ Band(g): Band #6, $\alpha=1$. Proposed configurations= $\pi 3/2[541] \otimes v 3/2[411]$ ([2021Zh57](#)).

^j Band(G): Band #6, $\alpha=0$. Proposed configurations= $\pi 3/2[541] \otimes v 3/2[411]$ ([2021Zh57](#)).

^k Band(H): Band #7, $\alpha=0$. Proposed configurations= $\pi 3/2[422] \otimes v 5/2[532]$ ([2021Zh57](#)); bands #7 and #10 can be G-M partners with $K^\pi=4^-$ and $K^\pi=1^-$.

^l Band(h): Band #7, $\alpha=1$. Proposed configurations= $\pi 3/2[422] \otimes v 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^m Band(I): Band #8, $\alpha=0$. Proposed configurations= $\pi 1/2[420] \otimes v 5/2[532]$ ([2021Zh57](#)); bands #8 and #9 can be G-M partners with $K^\pi=3^-$ and $K^\pi=2^-$.

ⁿ Band(j): Band #9, $\alpha=1$. Proposed configurations= $\pi 1/2[420] \otimes v 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^o Band(J): Band #9, $\alpha=0$. Proposed configurations= $\pi 1/2[420] \otimes v 5/2[532]$ ([2021Zh57](#)); bands #8 and #9 can be G-M partners with $K^\pi=3^-$ and $K^\pi=2^-$.

^p Band(k): Band #10, $\alpha=1$. Proposed configurations= $\pi 3/2[422] \otimes v 5/2[532]$ ([2021Zh57](#)). See also comment for $\alpha=0$ signature partner.

^q Band(K): Band #10, $\alpha=0$. Proposed configurations= $\pi 3/2[422] \otimes v 5/2[532]$ ([2021Zh57](#)); bands #7 and #10 can be G-M partners with $K^\pi=4^-$ and $K^\pi=1^-$.

^r Members of γ band, with transitions to band #1 ([2021Zh57](#)).

⁵⁸Ni(⁶⁴Zn,3pnγ) 2021Zh57 (continued)γ(¹¹⁸Cs)

Two-point $\gamma\gamma(\theta)$ (anisotropy): $R_{ac}=I\gamma(133.6^\circ+157.6^\circ)$ (versus all angles)/ $I\gamma(75.5^\circ+104.5^\circ)$ (versus all angles), with typical values of ≈0.8 for ΔJ=1 dipole, and ≈1.4 for ΔJ=2, quadrupole (likely E2). DCO=Iγ(157.6°,≈90°)/Iγ(≈90°,157.6°), with typical values of ≈1.0 for ΔJ=2, quadrupole (likely E2) and ≈0.46 for ΔJ=1, dipole transitions when gated on a ΔJ=2, quadrupole transitions, and ≈1.0 for ΔJ=1, dipole, and ≈2.1 for ΔJ=2, quadrupole, when gated on ΔJ=1, dipole transitions. Above description is from 2021Zh56 for ¹¹⁹Cs high-spin structure, a companion article of 2021Zh57. Here, DCO(Q) is for gates on ΔJ=2, quadrupole, and DCO(D) for gates on ΔJ=1, dipole transitions.

[†] From [2021Zh57](#), with uncertainties assigned by evaluator as 0.3 keV for E γ <500 keV, 0.7 keV for E γ =500-1000 keV, 1.0 keV for E γ >1000 keV and for I γ <1.0 relative units, based on authors' general statement in Table I, that uncertainties are <0.3 keV for E γ <500 keV, 0.7 keV for E γ =500 to 1000 keV, 1.0 keV for E γ >1000 keV and for I γ <1.0 relative units. Uncertainties of 0.5 keV for a few of the low-energy transitions below 200 keV or so from low-lying levels are assigned by the evaluator for the purpose of least-squares fitting of the level scheme.

[‡] From [2021Zh57](#), normalized to the intensity of the 200.1-keV, (10⁺) → (8⁺) transition in Band #1 in authors' Fig. 1.

From [2021Zh57](#), from $\gamma\gamma(\theta)$ and $\gamma\gamma$ (linear pol) data.

@ Ordering of the 64.7 γ → 61.4 γ and 46.3 γ → 79.0 γ cascades is not established ([2021Zh57](#)). Authors assign firm assignments from any one value or multiple values are available from $\gamma\gamma(\theta)$ (DCO), $\gamma\gamma$ (angular anisotropy) and $\gamma\gamma$ (linear polarization) available, and consistent with the assigned multipolarity. When none of these values are available, authors assign multipolarity in brackets. Evaluator assigns definite multipolarity only when $\gamma\gamma$ (linear polarization) data are available. In other cases, multipolarities M1+E2 or E2 are assigned in brackets when DCO and/or $\gamma\gamma$ (angular anisotropy) data are available, and reasonably consistent with those assigned by [2021Zh57](#). When no supporting data are available, evaluator has not assigned any multipolarity, with the exception of low-energy transitions of <100 keV or so with large conversion coefficients are large, where [M1+E2] is assumed, based on ΔJ^π . Although, DCO and angular asymmetry data are parity insensitive, evaluator assigns (M1+E2) and (E2), based on interconnected band structures, and lack of evidence for any long level lifetimes, making (E1+M2) and (M2) transitions highly unlikely, except a (7⁺) isomer at 125.9+x discovered by [2021Zh57](#) with $T_{1/2}=0.55 \mu s$ 6.

& Total theoretical internal conversion coefficients, calculated using the BrIcc code ([2008Ki07](#)) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.
