

^{122}Ag β^- decay: mixed source 1995Za01

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	T. Tamura	NDS 108, 455 (2007)	30-Sep-2006

Parent: ^{122}Ag : E=x; Q(β^-)=9500 SY; % β^- decay=? ^{122}Ag -E: Isomer-mixed source.1995Za01: $^{235}\text{U}(\text{n},\text{f})$ on-line MS; ^{122}Ag isomers without parent discrimination; measured γ , $\gamma\gamma$ -coin, $\beta\gamma\gamma$ -coin, $\gamma\gamma(\theta)$; deduced E(levels), $T_{1/2}$ (569.5 level), J^π .Excited states of ^{122}Cd was studied using mass-separated but isomer-mixed ^{122}Ag source. Since the excited states cover wide range of J^π from 0^+ to (8^+) , the source probably includes low- and high-spin isomers. Especially, the parent must feed 1705 ($J=0^{(+)}$) and 1992 ($J=0^{(+)}$) levels for $\gamma\gamma(\theta)$, and 2823 ($J=(8^+)$). ^{122}Cd Levels

E(level) [†]	J^π [‡]	$T_{1/2}$	Comments
0.0	0^+		
569.45 8	2^+	10 ps	$T_{1/2}$: Centriod-shift analysis of $\beta\gamma(t)$ coincidence spectra using NE111A and BaF ₂ scintillators with time-to-amplitude converter.
