

$^{123}\text{Te}(\text{}^3\text{He},3n\gamma)$  2001Ga25,1981Lu01

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Jun Chen	NDS 174,1 (2021)	15-Apr-2021

Also includes  $^{122}\text{Te}(\text{}^3\text{He},2n\gamma)$  from 1981Lu01 and  $^{122}\text{Te}(\alpha,3n\gamma)$  from 1997Sa09, 1970Ke01.

**2001Ga25:**  $^{123}\text{Te}(\text{}^3\text{He},3n\gamma)$ , E=24 MeV  $^3\text{He}$  beam was produced from the FN-tandem at the University of Cologne. Target was 15 mg/cm<sup>2</sup> self-supporting  $^{123}\text{Te}$  (99.3% enriched).  $\gamma$  rays were detected with 6 Compton-suppressed Ge detectors. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma\gamma$ -coin,  $\gamma\gamma(\theta)$ . Deduced levels, J,  $\pi$ , band structures,  $\gamma$ -ray multipolarities, mixing ratios, branching ratios. Comparisons with theoretical calculations.

**1981Lu01:**  $^{122}\text{Te}(\text{}^3\text{He},2n\gamma)$ ,  $^{123}\text{Te}(\text{}^3\text{He},3n\gamma)$ , E=14-27 MeV  $^3\text{He}$  beam was produced from the Jyvaskyla University MC-20 cyclotron. Targets were 7-10 mg/cm<sup>2</sup> self-supporting  $^{122}\text{Te}$  (91% enriched) and  $^{123}\text{Te}$  (67% enriched).  $\gamma$  rays were detected with planar HPGe detectors and coaxial Ge(Li) detectors; conversion electrons were detected with an intermediate-image magnetic-plus Si(Li) electron spectrometer (FWHM=3.0 keV at 1 MeV). Measured  $E\gamma$ ,  $I\gamma$ , E(ce), I(ce),  $\gamma\gamma$ -coin,  $\gamma(\theta)$ ,  $\gamma(t)$ . Deduced levels, J,  $\pi$ , band structures, isomeric  $T_{1/2}$ ,  $\gamma$ -ray multipolarities, mixing ratios, conversion coefficients. Comparisons with theoretical calculations. Most of the data are from ( $^3\text{He},2n\gamma$ ) measurement.

**1997Sa09:**  $^{122}\text{Te}(\alpha,3n\gamma)$ , E=40 MeV  $\alpha$  beam was produced from the Variable Energy Cyclotron, Calcutta.  $\gamma$  rays were detected with coaxial HPGe detectors. Measured  $E\gamma$ ,  $I\gamma$ ,  $\gamma\gamma$ -coin,  $\gamma(\theta)$ . Deduced levels, J,  $\pi$ ,  $\gamma$ -ray multipolarities, mixing ratios, branching ratios. Comparisons with available data and theoretical calculations.

Others:  $^{122}\text{Te}(\alpha,3n\gamma)$ , 1970Ke01 (1970KeZV,1970KeZO), 1978Gi16.

 $^{123}\text{Xe}$  Levels

Band assignments are from 2001Ga25.

185.27 17	7/2(-)	5.8 $\mu\text{s}$ 3	E(level): the position of this isomeric state is proposed by 1981Lu01 based on their observation of the 66.7 $\gamma$ in coincidence with 266.4 $\gamma$ and 515.7 $\gamma$ both feeding the 252 level. $J^{\pi}$ : other: 1970Ke01 tentatively assign $J^{\pi}=9/2^-$ and E<250 keV to this isomer and proposed that this isomer feeds the 181 level by a M2 transition. $T_{1/2}$ : weighted average of 5.6 $\mu\text{s}$ 3 from $\gamma(t)$ of 97.3 $\gamma$ , 83.2 $\gamma$ and 180.6 $\gamma$ in 1981Lu01, and 6.3 $\mu\text{s}$ 5 from 97.3 $\gamma(t)$ and 83.2 $\gamma(t)$ in 1970Ke01.

<sup>†</sup> Values are mostly from [2001Ga25](#) with no uncertainties, and values with uncertainties are from [1998Sc23](#), unless otherwise noted.

<sup>‡</sup> Quoted values are branching ratios from [2001Ga25](#), unless otherwise noted. Relative intensities to  $I_\gamma(97\gamma)=1000$  are available with uncertainties in [1981Lu01](#) and without uncertainties in [1997Sa09](#), and given under comments (renormalized to  $I_\gamma(97\gamma)=100$  by the evaluator). Where available, weighted average are taken from values in [2001Ga25](#) and values converted from relative intensities in [1981Lu01](#). The uncertainties of relative intensities in [1981Lu01](#) are assigned as follows by the evaluator based on a general statement of 10% for larger peaks and 30% for small peaks: 10% for  $I_\gamma \geq 5$  and 30% for  $I_\gamma < 5$ , relative to  $I_\gamma=100$  for 97 $\gamma$ .

<sup>#</sup> [2001Ga25](#) state that the value is from [1998Sc23](#). But no intensity data are quoted by [1998Sc23](#).

@ [2001Ga25](#) state that the value (quoted as nearest tenth of a keV) is from [1998Sc23](#). However, the values of  $E_\gamma$  are the nearest keV in [1998Sc23](#).

$\gamma(^{123}\text{Xe})$  (continued)

<sup>&</sup> From  $\gamma\gamma(\theta)$  in 2001Ga25 with  $\Delta J=1$  for D+Q and  $\Delta J=2$  for Q, unless otherwise noted. For some transitions,  $\alpha(\text{K})_{\text{exp}}$  data in 1981Lu01 are used to determine the electric or magnetic nature.  $\gamma(\theta)$  data are also available in 1981Lu01 with  $A_2$  and  $A_4$  values given under comments. No  $A_2$  and  $A_4$  values of  $\gamma\gamma(\theta)$  are given in 2001Ga25. Other  $\delta$  values from 2001Ga25 given under comments are those not adopted by the authors.

<sup>a</sup> From  $\gamma(\theta)$  in 1981Lu01, with  $\Delta J=1$  (except for 0 for 215 $\gamma$ ) for D+Q and  $\Delta J=2$  for Q. Where available,  $\alpha(\text{K})_{\text{exp}}$  data in 1981Lu01 are used to determine the electric or magnetic nature.

<sup>b</sup> Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on  $\gamma$ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

<sup>c</sup> Multiply placed with intensity suitably divided.

<sup>d</sup> Placement of transition in the level scheme is uncertain.
