1995Ph01: $E({}^3\text{He})=200$ MeV; enriched target, magnetic spectrograph, $\theta=0^\circ$ and 2° , FWHM ≈ 80 keV.
Triton energy spectrum displayed IAR at excitation energy 12.19 MeV 3.

 ^{124}Sb Levels

All levels, except 150, 1330, and 1500 are populated weakly (1995Ph01).

$\Delta L=0$ identified by cross sections at 0° and 2° , some $\Delta L=1$ strength is also observed, although no discrete states are indicated (1995Ph01).

Although $L=0$ allows $J=0^+, 1^+$; $J=1^+$ are expected to be strongly populated in this reaction.
