¹²⁹Nd(0)-J^π,T_{1/2}: From Adopted Levels for all the three activities.
¹²⁹Nd(0)-Q(ε): 7460 200 (syst,2012Wa38).

1997Gi07: ¹²⁹Nd activity produced in bombardment of ⁹²Mo and ⁹⁴Mo targets by E=210, 255 MeV ⁴⁰Ca beam at Grenoble, IGISOL technique to identify A=129 isotopes. Measured Eγ, Iγ, Iβ, γγ(t) and (x ray)(γ)(t), half-life of ¹²⁹Nd g.s. This work is a short note; complete details of the level scheme are not available.
 2010Xu12: ¹²⁹Nd formed in ⁹⁶Ru(³⁶Ar,3p) at 220 MeV and ⁹²Mo(⁴⁰Ca,3p) at 173 MeV; tape transport system, measured Eγ, Iγ, γγ, (x ray)γ coin, (proton)γ coin, decay curves for half-life determination.

[†] 346.6 γ is a doublet with separate intensities given in **1997Gi07**, but the authors did not specify these intensities with levels. The evaluators have arbitrarily assigned higher intensity to the decay of the low-lying level.

[‡] γ also reported In **2010Xu12** with the same energy As In **1997Gi07**. No intensity is given.

[#] From **2010Xu12**, in coin with 134.0 γ , both assigned to the decay of 2.6-s activity.

@ **2010Xu12** assign this γ to 2.6-S activity of ^{129}Nd , and In coin with a 399.0 γ .

& Poor fit, level-energy difference=883.9.

^a Total theoretical internal conversion coefficients, calculated using the BrIcc code (**2008Ki07**) with Frozen orbital approximation based on γ -ray energies, assigned multiplicities, and mixing ratios, unless otherwise specified.

^b Multiply placed with intensity suitably divided.

^x γ ray not placed in level scheme.
