

$^{110}\text{Cd}(\text{Si},\alpha p 3n\gamma)$ 1988Ma20

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh	NDS 93, 33 (2001)	11-May-2001

1988Ma20: E=160 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ using an array of four Compton-suppressed Ge detectors.

 ^{130}Pr Levels

The ordering of the 184.8-89.5-110.1 cascade is reversed in Adopted Levels, thus altering the level energies concerned.

[†] Add≈58 keV to each level energy to match these levels with those in Adopted Levels, except when a different placement for a γ ray is indicated.

[‡] From 1988Ma20, based on $\gamma\gamma(\theta)$ (DCO) and band structures. Each spin should be decreased by one unit to match with the one given in Adopted Levels.

[#] x should be replaced by 58+x to match with Adopted Levels.

[†] $I\gamma(89.5)/I\gamma(110.1) \approx 0.5$ observed in the spectrum gated by 184.8γ is consistent with (M1) for 89.5γ and E1 for 110.1γ .

[‡] Lower limit from summing the intensity of feeding transitions.

[#] From level-energy difference. γ shown only in the level scheme by 1988Ma20.

[@] Placement of transition in the level scheme is uncertain.
