**1996Pe08**,**1996Pe06**: E=130 MeV. Measured  $\gamma$ ,  $\gamma\gamma$ ,  $\gamma\gamma(\theta)$  using GASP array with 40 Ge detectors and 80 BGO inner-ball detectors.

**1995CI02**:  $^{100}\text{Mo}(^{40}\text{Ar},4n\gamma)$  E=176, 182 MeV. Gammasphere array (36 and 24 detectors). Measured  $E\gamma$ ,  $\gamma\gamma\gamma$  coin. Deduced multiple SD bands.

**1987Bi13** (also **1987Bi14**,**1987Bi07**):  $^{110}\text{Pd}(^{30}\text{Si},4n\gamma)$  E=120-125 MeV. Measured  $\gamma\gamma$ -n (Ge(Li),scin);  $\gamma(\theta,H,t)$ . Lifetimes by RDM, DSAM.

**1986Ba63**: Measured continuum  $\gamma$ 's and deduced moments of inertia.

**1980AI23**:  $^{100}\text{Mo}(^{40}\text{Ar},4n\gamma)$  E=170 MeV. Measured  $\gamma$ -ray multiplicities versus  $E\gamma$ . Deduced effective moment of inertia.

**1973PaZV**:  $^{120}\text{Sn}(^{20}\text{Ne},4n\gamma)$ . Measured  $E\gamma$ ,  $\gamma\gamma$ -coincidences, and  $\gamma(\theta)$ . Tentative band assignments based on excitation functions and coincidence measurements.

**1972Ha23**:  $^{140}\text{Ce}(\alpha,8n\gamma)$  and  $^{136}\text{Ce}(\alpha,4n\gamma)$ .

SD band data are from **1999Pe19**, **1995CI02**, **1996Pe08** and **1987Be32**. Others: **1997Ni04**, **1997FI03**.

Normal deformed levels are mainly from **1996Pe06**, **1996Pe08** and **1999Pe19**. In **2008Mu18** and **2002Me25**, a 4-qp band based on  $11^-$ , as proposed by **1996Pe06**, was revised (bandhead spin increased to  $14^-$  and excitation energy adjusted) based on identification of multiple weak linking transitions. In addition, a new, nearly degenerate dipole band was identified in both **2002Me25** and **2008Mu18**.

 $^{136}\text{Nd}$  Levels

g-factors are obtained by simultaneous fit of  $14^+ \rightarrow 12^+ \rightarrow 10^+ \rightarrow 8^+$  cascade with assumption of equal g factors for  $12^+$  and  $10^+$ .

Fitting the 3686 level independently yields a slightly smaller g factor whose uncertainty overlaps the mean value (**1987Bi13**,**1987Bi14**).

<sup>m</sup> Band(N): Possible  $K^\pi=2^+$ ,  $\gamma$  band.

<sup>n</sup> Band(O): SD-1 band (1999Pe19,1995Cl02,1987Be32). Percent population=2.0 (1987Be32). See also 1997Ni04 for relative population of the band.

<sup>o</sup> Band(P): SD-2 band (1999Pe19,1995Cl02). Percent population  $\approx 0.4$  (from an estimated 20% intensity of the yrast SD band (1995Cl02)). See also 1997Ni04 for relative population of the band. First three transitions in this band at 893, 949 and 1018 reported by 1995Cl02 are assigned to normal-deformed levels by 1999Pe19. This band was suggested (1995Cl02) to be identical (at half points of the transition energies of SD-1 band) to the yrast SD band (SD-1) in <sup>136</sup>Nd. But this conclusion is rejected by 1999Pe19, based on newer set of low-energy gamma rays. Probable particle structure is suggested (1995Cl02) as excitation of a 3/2[541] proton to the 5/2[532] orbital.

<sup>p</sup> Level observed in 2002Me25.  $J^\pi$  from DCO ratios, although no details provided.

<sup>q</sup> Band(Q): Band based on  $13^-$  state. Band Q and R originally interpreted in 2002Me25 as chiral doublet. Lifetime measurements in 2008Mu18 yielding large differences in the transition probabilities in the two bands suggest that they are two different configurations undergoing band mixing.

<sup>r</sup> Band(R): Band based on  $14^-$  state. See comment on Band Q.

<sup>s</sup> From DSAM in 2008Mu18.

<sup>†</sup> From 1999Pe19 and 1996Pe08, when uncertainties are given, others are from 1996Pe06 and 1996Pe08, except where noted.

Values for SD-1 and SD-2 bands are also reported by 1995CI02, and for SD-1 by 1987Be32.

<sup>‡</sup> From 1999Pe19, except where noted. Values for SD-1 band are relative to 1.0 for 857.9 $\gamma$ .

# From 1999Pe19. The  $\gamma$  ray is involved in the decay of SD-1 band, but exact placement is not yet established.
