2013Li24: E=103 MeV ^{19}F beam was produced from the HI-13 tandem accelerator at CIAE facility in China. Target was 3 mg/cm² ^{124}Te on a 4 mg/cm² gold foil backing. γ rays were detected with an array of nine Compton-suppressed HPGe detectors, two planar HPGe detectors, and one Clover detector. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, $\gamma\gamma(\theta)$ (DCO). Deduced levels, J , π , bands, configurations, γ -ray multipolarity. Comparisons with Triaxial projected shell-model calculations.
