

⁹²Mo(⁵⁰Cr,n2pγ) 1989Ma03,1990Ma53,1997Ro13

| Type | Author | History | Citation | Literature Cutoff Date |
|-----------------|---|---------|-------------------|------------------------|
| Full Evaluation | P. K. Joshi, B. Singh, S. Singh, A. K. Jain | | NDS 138, 1 (2016) | 15-Oct-2016 |

E=210-230 MeV.

1989Ma03: E=200-230 MeV. Measured E_γ, I_γ, γγ, excitation functions, γγ(θ) using five BGO-shielded Ge detectors and a multiplicity filter of 14 BGO detectors. Main experiment at 210 MeV beam energy. Deduced average directional correlation (DCO) ratios. A negative-parity band established from 9/2⁻ to 35/2⁻ and ascribed to νh_{11/2} 9/2[514] configuration, crossed at higher spins by a pair of h_{11/2} protons.

1990Ma53 (same group as **1989Ma03**): E=220 MeV. Measured E_γ, I_γ, γγ, γγ(θ)(DCO) using TESSA3 array of 16 Ge detectors and 50 BGO inner ball detectors. An i_{13/2} intruder highly-deformed band and several other sequences were found in this study, but no data details were provided.

1991Pa04 (same group as **1990Ma53** and same experimental arrangement used): measured γ(θ) and deduced mixing ratios for nine transitions in the 9/2[514] band.

1992Pa04 (same group as **1990Ma53** and same experimental arrangement used): measured Doppler-shift attenuations for γ rays in the highly-deformed (decoupled) band; deduced intrinsic quadrupole moment for the band and quadrupole deformation from lifetime measurements for seven transitions in the band.

1997Ro13 (also **1995Ro15**): E=220 MeV. Measured E_γ, I_γ, γγ, γγ(θ)(DCO) using GASP array of 40 Ge detectors and 80 BGO inner-ball detectors. Details of data on highly-deformed band and negative parity based on the ground state.

Main level scheme is from **1990Ma53**, except that the 1/2[660] band linkage to lower section of the level scheme is from **1997Ro13**.

[†] From least-squares fit to E_γ data, ΔE(γ)=1 keV assumed when not given.

[‡] This level decays to 2174.7 level, but connecting E_γ is not known.

As proposed in 1989Ma03, 1990Ma53 and 1997Ro13 based on DCO ratios, band structures, systematics of N=75 isotones and decay patterns. The assignments are the same in Adopted Levels, except that all are given in parentheses there due to lack of strong supporting arguments.

@ Lifetime measured in 1992Pa04 (see F(τ) curve in figure 2 of 1992Pa04).

& Band(A): ν9/2[514] α=-1/2. At low spins, this band is from νh_{11/2} 9/2[514] orbital. At ħω≈0.3 MeV and J^π=23/2⁻, this band is crossed by a pair of h_{11/2} protons, thus evolves into a 3-qp configuration=ν9/2[514]⊗ πh_{11/2}². This band was first proposed in 1989Ma03, later confirmed in 1990Ma53, 1991Pa04 and 1997Ro13.

^a Band(a): ν9/2[514], α=+1/2. See comment for the α=-1/2 partner.

^b Band(B): ν1/2[530] band. Band from νh_{9/2} orbital (1997Ro13).

^c Band(C): ν1/2[660], Highly deformed band. Q(intrinsic)≈7.0 (1992Pa04) from lifetime measurements of seven transitions in the band. Band from νi_{13/2} orbital (1997Ro13,1990Ma53).

^d Band(D): ΔJ=(1) band. Band from 1990Ma53 only.

^e Band(E): ΔJ=1 band. Band from 1990Ma53 only.

^f Band(F): ΔJ=(1) band. Band from 1990Ma53 only.

γ(¹³⁹Gd)

DCO values correspond to gates on ΔJ=2, quadrupole transitions. Expected values are: ≈1 for ΔJ=2, Q and ≈0.5 for ΔJ=1, dipole transitions (1997Ro13); ≥1.0 for ΔJ=2, Q and ≤0.7 for ΔJ=1, transitions (1989Ma03).

[†] Values given with uncertainties are from 1989Ma03. Values with no uncertainties are from 1990Ma53, unless otherwise noted.

[‡] From 1989Ma03, normalized to $I_\gamma(543\gamma)=100$ with typical uncertainty quoted as <10%, except as noted. The evaluators assign 10% uncertainty. Values listed are relative intensities, but for 1/2[660] band, values are relative within the band.

[#] Mult=Q indicates stretched quadrupole (most likely E2), mult=D indicates stretched dipole (most likely M1 or M1+E2, except E1 for 616 γ from 17/2⁺ level) from DCO ratios. Mult=M1+E2 is from measured DCO ratio, significantly large δ value and implied RUL. Mult=E2 is from DCO ratio and RUL; level lifetimes are not listed but are implied as short (in ps region) from transition quadrupole moment deduced from these measurements in 1992Pa04.

[@] Read by the evaluators from figure 1 of 1991Pa04.

[&] From 1997Ro13.

^a From 1997Ro13. Values in 1997Ro13 are normalized to 100 for $I_\gamma(212\gamma+530\gamma)$; these have been renormalized by the evaluators to $I_\gamma(212\gamma+530\gamma)=227.19$ to match the intensity scale in 1989Ma03, from which other I_γ values are taken.

^b From 1997Ro13, relative intensity within the band, normalized to 100 for the 459 transition.

^c Doppler-shift attenuation measurement for this γ transition in the highly-deformed band (1992Pa04).

^d Doublet with a transition in ^{140}Gd .

^e Placement of transition in the level scheme is uncertain.

$^{92}\text{Mo}(^{50}\text{Cr},n2p\gamma)$ 1989Ma03,1990Ma53,1997Ro13

Legend

Level Scheme
Intensities: Relative I_γ

- $I_\gamma < 2\% \times I_\gamma^{max}$
- $I_\gamma < 10\% \times I_\gamma^{max}$
- $I_\gamma > 10\% \times I_\gamma^{max}$
- - - - - γ Decay (Uncertain)

$^{92}\text{Mo} (^{50}\text{Cr}, n2p\gamma)$ 1989Ma03, 1990Ma53, 1997Ro13

Level Scheme (continued)

Intensities: Relative I_γ

Legend

- $I_\gamma < 2\% \times I_\gamma^{\max}$
- $I_\gamma < 10\% \times I_\gamma^{\max}$
- $I_\gamma > 10\% \times I_\gamma^{\max}$
