2009GuZU, 2003GuZU, 2003GuZV: (pol p, α): E=23.5 MeV. Measured $\sigma(\theta)$, analyzing powers $A_y(\theta)$ using Q3D magnetic spectrograph at Munich, DWBA analysis. Target= $^{142}\text{Nd}_2\text{O}_3$ enriched to 98.26%, thickness=82 $\mu\text{g}/\text{cm}^2$ on 8 $\mu\text{g}/\text{cm}^2$ carbon backing.

1980HaZE: E=17 MeV, measured $\sigma(\theta=6.5^\circ-65^\circ, 12 \text{ angles})$; mag spect, delay-line counter. Levels shown are those observed in the 20° spectra.

1996Gu03: (p, α): E=23.1 MeV; measured $\sigma(\theta)$; deduced angle integrated σ .

Other: **1983Ga04:** E \approx 24 MeV, investigated role of unpaired nucleon.

[†] From [2003GuZU](#), unless stated otherwise. From spectral Fig. 1 in [2003GuZV](#), FWHM seems about 10 keV. The uncertainties are probably about 5 keV.

[‡] Most intensely populated level.

[@] From $\sigma(\theta)$ and $A_y(\theta)$ with DWBA analysis ([2009GuZU](#)).
