5460.9 \ddagger 9	(18 $^+$)	
6422.9 \ddagger 13	(20 $^+$)	

\dagger 1989Pa01 J^{π} values are based on measured DCO, deformation (g.s. quoted values: $\beta=0.236$, $\gamma=-20^\circ$, Lund convention), and in-band $I\gamma$'s. For the g.s. band the assignments are definite (unambiguous 0 $^+$ of g.s., E2 329 γ and measured stretched Q's for other in-band γ 's). The π assignments are tentative for the other bands (based on systematics).

\ddagger Band(A): yrast g.s. band.

$\#$ Band(B): K=2 $^+$ γ -vibrational band.

$@$ Band(C): negative parity band.

$\&$ Band(D): positive parity band.

962 1	<5	6422.9	(20 ⁺)	5460.9 (18 ⁺)				

[†] Based on measured DCO values (intensity asymmetries) from gates on Q transitions of g.s. band by 1989Pa01. Values ≥ 1.0 are quoted as typical for stretched-Q transitions and ≤ 0.7 for stretched-D transitions. No mult are explicitly assigned, but from J^π assignments only the E1, E2, and M1+E2 possibilities are considered by 1989Pa01. No criteria are given for non-stretched and/or mixed transitions, although definite assignments are done by 1989Pa01 for such transitions based on the typical values for stretched transitions.

[‡] From 1989Pa01 at $E(^{50}\text{Cr})=210$ MeV.

[#] Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

[@] Placement of transition in the level scheme is uncertain.
