

$^{92}\text{Mo}(^{54}\text{Fe}, 2\text{pn}\gamma)$ 2000O110

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	E. Browne, J. K. Tuli		NDS 113, 715 (2012)	31-May-2011

2000O110: E=240 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$, and $\gamma\gamma(\theta)$ (DCO) using GASP spectrometer consisting of 40 Compton-suppressed high-efficiency HPGe detectors, and an 80-element BGO inner ball, in conjunction with the multi-telescope light-charged-particle detector array, ISIS.

2005Ri17: $^{92}\text{Mo}(^{54}\text{Fe}, 2\text{pn}\gamma)$, E=25 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ coin using the jurogam array of 43 HPGe detectors with the recoil ion transport unit (RITU).

[†] Deduced by evaluators from least-squares fit to γ -ray energies in 2005Ri17.

[‡] As given in 2000O110. The assignments are based on $\gamma\gamma(\theta)$ (DCO) data for selected transitions and expected band structures from model calculations.

Probably an isomer; decay mode is unknown.

@ Reported in 2005Ri17 only.

& Band(A): Band based on (17/2⁻), $\alpha=+1/2$. Above 27/2⁻, strong dipole (M1) transitions suggest possible magnetic-rotational character with configuration= $\pi h_{11/2}^2 \nu h_{11/2}^{-1}$ (2000O110).

^a Band(a): Band based on (17/2⁻), $\alpha=-1/2$. See comments for its signature partner.

^b Band(B): Yrast structure (irregular) based on $\nu h_{11/2}$. Probably a weakly deformed structure.

^c Band(C): Band based on (21/2).

^d Band(D): Band based on (13/2⁺). Possibly based on $\nu i_{13/2}$ orbital.

^e Band(E): Band based on 11/2⁻.

^f Band(F): Band based on 11/2⁻.

^g Band(G): γ cascade based on (19/2⁻).

$\gamma(^{143}\text{Dy})$

Multipolarities of transitions are not explicitly quoted here. From $\gamma\gamma(\theta)$ (DCO) data, R(DCO)=1.0 implies $\Delta J=2$, stretched quadrupole (E2 in general); R(DCO)=0.56 implies $\Delta J=1$, stretched dipole; and R(DCO)=1.07 implies $\Delta J=0$, dipole for the geometry used in 2000O110.

[†] $\Delta(E_\gamma)=0.2$ keV for $I_\gamma>1$; 0.5 keV for transitions with $I_\gamma\leq 1$ and for transitions of $E_\gamma>1$ MeV, based on a general statement by **2000O110**.

[‡] May be an underestimate due to probable decay from an isomeric state.

[#] From sum of intensity of feeding transitions (723 γ +752 γ +1044 γ +1069 γ) normalized to 100.

[@] Reported in **2005Ri17** only.

[&] Multiply placed with intensity suitably divided.

^a Placement of transition in the level scheme is uncertain.

$^{92}\text{Mo}(\text{}^{54}\text{Fe}, 2\text{pn}\gamma)$ 2000O110

Legend

Level Scheme
Intensities: Relative I_γ

- $I_\gamma < 2\% \times I_\gamma^{\text{max}}$
- $I_\gamma < 10\% \times I_\gamma^{\text{max}}$
- $I_\gamma > 10\% \times I_\gamma^{\text{max}}$
- - - - -→ γ Decay (Uncertain)
