**1993Li18:** <sup>92</sup>Mo(<sup>58</sup>Ni,3npγ), E=287 MeV; the first observation of <sup>146</sup>Tm(p) decay. Two proton peaks were reported. Recoil Separator, plantation detection system.

**2001Ry01,2003Gi10,2006Ta08,2007BaZQ:** <sup>92</sup>Mo(<sup>58</sup>Ni,3npγ), E=297 MeV; measured <sup>146</sup>Tm(p): E(p), I<sub>p</sub>, T<sub>1/2</sub>(p). Deduced levels, J<sup>π</sup>, configurations. Ion-beam facility at HRIBF, recoil mass-separator. Particle-core vibration coupling model.

**2005Ro40,2007DaZU:** <sup>58</sup>Ni(<sup>92</sup>Mo,3npγ), E not given; measured Eγ, Iγ, γγ, (recoil)γ coin., <sup>146</sup>Tm(p): E(p), I<sub>p</sub>, T<sub>1/2</sub>(p). Deduced levels, J<sup>π</sup>, band. Gammasphere array, Fragment Mass Analyzer, RDT technique.

Others: [2001Ry02](#), [2005Bb02](#).

The level scheme of <sup>146</sup>Tm was studied by two experimental groups using the reactions <sup>92</sup>Mo(<sup>58</sup>Ni,3npγ) and <sup>58</sup>Ni(<sup>92</sup>Mo,3npγ).

Five delayed proton lines were detected and half-lives of p-decaying states were measured. In the first reaction ([2006Ta08](#)), the g.s., J=(5<sup>-</sup>), T<sub>1/2</sub>=68 ms 3 and the isomer J=(10<sup>+</sup>), T<sub>1/2</sub>=198 ms 3 were determined; in the second reaction ([2005Ro40,2007DaZU](#)), g.s., J=(1<sup>+</sup>), T<sub>1/2</sub>=155 ms 2, two excited states J=(5<sup>-</sup>), T<sub>1/2</sub>=82 ms 4, J=(10<sup>+</sup>), T<sub>1/2</sub>=213 ms 9 were determined. In actual fact, according to systematics of odd-odd N=77 isotones <sup>140</sup>Eu and <sup>142</sup>Tb have g.s., J=1<sup>+</sup>, however, g.s. of <sup>144</sup>Ho is determined as J=5<sup>-</sup> by [2006Ta08](#) and also by [2010Ma08](#) for the <sup>144</sup>Ho. The J=1<sup>+</sup> appears above the g.s. for <sup>144</sup>Ho and also for <sup>146</sup>Tm due to filling of the d<sub>5/2</sub> proton orbital. For this reason, the evaluators give preference to the level scheme of <sup>146</sup>Tm with g.s., J=(5<sup>-</sup>).
