2006Ve04: E=90 MeV; measured E γ , I γ , $\gamma\gamma$ using Euroball 3 spectrometer containing 15 cluster Ge detectors, 26 clover Ge detectors, and 30 tapered single crystal Ge detectors. No I γ 's and $\Delta E\gamma$'s are reported.

[†] From least-squares fit to E γ 's. As no uncertainties are available for the E γ input, the E(level) values are calculated with the assumption that the uncertainties are the same (of 1 keV) for all the E γ 's.

[‡] Assigned by **2006Ve04** based on the assumptions that in the yrast decays, spin values increase with excitation energy, and by analogy with level structure of well-known neighboring isotones.

[#] Band(A): Band 1, yrast band based on $\nu_{i13/2}$ orbital (**2006Ve04**).

[@] Band(B): Cascade 5, possible octupole band based on $\nu_{i13/2} \otimes 3^-$ (**2006Ve04**). 2190 level and 566 γ are common with those in ²⁵²Cf SF decay (**1999Sa58**), while all the other levels and γ 's are different.

[&] Band(C): Cascade 6.
