

$^{89}\text{Y}(^{60}\text{Ni},\text{p}\gamma)$ **1985Br07**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	N. Nica and B. Singh		NDS 181, 1 (2022)	9-Mar-2022

E=230-250 MeV. Also includes $^{90}\text{Zr}(^{60}\text{Ni},2\text{p}\gamma)$ and $^{92}\text{Zr}(^{58}\text{Ni},2\text{p}\gamma)$.

 ^{147}Dy Levels

[†] From least-squares fit to Eγ's.

[‡] From Adopted Levels from g.s. up to the 750-keV level inclusive. The remaining levels have J^π assigned by 1985Br07 on the basis of shell-model considerations. All assignments are tentative (evaluator).

From Adopted Levels.

@ From 1985Br07 in ($^{60}\text{Ni},\text{x}\gamma$).

[†] Normalized to 100 for the 1653.4-keV photon intensity. Delayed intensities from decay of 0.4- μ s isomer (3407 level).

[‡] Normalization with respect to the intensities of the lines below the 0.4- μ s isomer (3407 level) is estimated to be accurate within a factor of 2.

[#] From Adopted Gammas for transitions below the 750.4-keV level. Remaining assignments are taken from 1985Br07 who assign them based on intensity-balance considerations and J^π values of initial and final levels.

[@] From α extracted from intensity-balance requirements by 1985Br07.

[&] Obtained from $I_\gamma=24$ 2 for the 244.1-244.3 doublet by assuming $I(\gamma+ce)$ of the 244.1-keV transition equals that of the 677.2-keV ¹⁴⁷Dy transition.

^a Placement of transition in the level scheme is uncertain.
