1976St10: E(α)=27 MeV from the McMaster University Tandem. Enriched 95.4% ¹⁴⁸Nd target on carbon foils. The tritons were analyzed with magnetic spectrograph. $\sigma(\theta)$ data at two angles were measured.

[†] As indicated by $\sigma(\alpha,t)/\sigma(^3\text{He,d})$ ratios given in figure 7 by **1976St10**. The actual L-values assigned by **1976St10** differ in some cases since $\sigma(\theta)$ results in ($^3\text{He,d}$) are also used.

[‡] $\sigma(\text{exp})/(N\times\sigma(\text{theory}))$. $\sigma(\text{theory})$ is derived from DWBA calculation with N=111. Relative and absolute cross sections are accurate to 15% and 30%, respectively. **1976St10** also give adopted values derived from (α,t) and ($^3\text{He,d}$) reactions.
