

$^{144}\text{Sm}(^7\text{Li},2n\gamma)$ **1991La17**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh and Jun Chen		NDS 185, 2 (2022)	23-Aug-2022

1991La17: E=32 MeV ^7Li beam was produced from the Tandem accelerator at Cologne University. γ rays were detected with the Osiris multidetector array consisting of 12 Compton-suppressed Ge detectors. Measured E_γ , I_γ , $\gamma\gamma$ -coin, $\gamma\gamma(\theta)$ (DCO). Deduced levels, J^π , multipolarities. Comparisons with theoretical calculations. **1991La17** also report data on $^{151}\text{Eu}(\alpha,6n\gamma)$.

 ^{149}Tb Levels

[†] From least-squares fit to γ -ray energies.

[‡] As given in **1991La17**, based on their $\gamma(\theta)$ data in $(\alpha,6n\gamma)$, $\gamma\gamma(\theta)$ (DCO) data in $(^7\text{Li},2n\gamma)$ and pol data for selected transitions. Some of the assignments in **1991La17** are from theoretical predictions. The assignments are the same in the Adopted Levels, except that several are placed in parentheses there as strong arguments seem lacking.

¹⁴⁴Sm(⁷Li,2n γ) **1991La17** (continued)

¹⁴⁹Tb Levels (continued)

- # Seq.(B): $\pi h_{11/2} \otimes \nu f_{7/2}^2$ multiplet.
- @ Seq.(C): $\pi h_{11/2} \otimes \nu f_{7/2} \otimes \nu h_{9/2}$ multiplet.
- & Seq.(D): $\pi h_{11/2} \otimes \nu f_{7/2}^2 \otimes (3^- \text{ in } ^{146}\text{Gd})$ multiplet.
- ^a Band(A): $\pi h_{11/2}^2 \otimes \pi d_{5/2}^{-1} \otimes \nu f_{7/2}^2$ multiplet.

$\gamma(^{149}\text{Tb})$

DCO values given under comments are from **1991La17**. The gating transition is generally $\Delta J=2$, E2, in which case $\text{DCO} \approx 1$ suggests $\Delta J=2$, quadrupole; $\text{DCO} \approx 2.0$ suggests $\Delta J=1$, dipole; $\text{DCO} > 1$ suggests $\Delta J=1$, dipole+quadrupole.

E_γ †	I_γ †	$E_i(\text{level})$	J_i^π	E_f	J_f^π	Mult. ‡	Comments
