

^{152}Eu ε decay (13.517 y)

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	M. J. Martin	NDS 114, 1497 (2013)	31-Aug-2013

Parent: ^{152}Eu : $E=0.0$; $J^\pi=3^-$; $T_{1/2}=13.517$ y 14; $Q(\varepsilon)=1874.6$ 7; $\% \varepsilon + \% \beta^+$ decay = 72.08 13

^{152}Eu - $\% \varepsilon + \% \beta^+$ decay: The absolute intensity of the 1408 γ has been evaluated to be 20.85% 9 (2007BeZP). Normalization of the photon intensities to $I_\gamma(344\gamma \text{ in Gd})=100$ gives $I_\gamma(1408\gamma)=78.41$ 10 and $\Sigma I(\gamma+\text{ce})(\text{to Gd g.s.})=105.02$ 18. From these data one gets branching (β^-)=27.92 13 and thus branching (ε)=72.08 13.

ce: 1991Go22, 1990Ka35, 1988KaZF, 1987BaYQ, 1985Co08, 1983KaZJ, 1982TrZV, 1981Ka40, 1979De22, 1978Ar24, 1970SpZW, 1968Bo38, 1967Ma29, 1966He02; other: 1990Ka43, 1983Ha34.

$\gamma\gamma$: 1981Is12, 1980Sh15, 1972Bb05, 1971Ba54, 1971Ba63, 1971Ha06, 1970Ka43, 1970Ri19.

$\gamma\gamma(\text{t})$: 1993Se08 (centroid shift), 1988Ka21, 1972El20, 1968Ku03, 1966Mc07, 1963Fo02, 1962Ba38, 1955Su64.

$\gamma\gamma(\theta)$: 1982La26 (evaluation of $E0+M1+E2$ measurements to 1980); others: 1973Ka05, 1971Ba54, 1971Ho08, 1971La11, 1971Ru05, 1970Ba32, 1970He29, 1970RaZF, 1970Ru09, 1969Aq01.

$\gamma\gamma(\theta, \text{H})$: 1971Do17, 1962Ba38.

$\gamma(\theta, \text{H}, \text{T})$: 1985KrZU, 1975Ba69; other: 1983Bl07.

$\gamma\gamma(\theta, \text{H}, \text{t})$: 1992De29.

β^+ : 1977MiZV, 1972Sv02; others: 1962Pe05, 1959An31, 1958Al99.

ε : 1976ScZS, 1975Da13.

Monoenergetic e^+ : 1972Sv02; others: 1965Pe12, 1964Sh15, 1962Pe05, 1960Va21.

 ^{152}Sm Levels

Additional possible levels have been proposed at 1436.65 and 1681.36 keV (1990St02, 1993Ka30). However, 1992Ya12 have searched for the γ 's reported as depopulating these levels and set an upper limit for their intensity which is considerably lower than the intensity reported by 1990St02 and 1993Ka30. EXCEPT FOR the 1315 γ proposed from the 1681 level, these transitions have also not been seen by 2007Ku20. The 1681 level, deexcited by α 1315 γ is adopted here.

Absolute intensity per 100 decays.

¹⁵²Eu ε decay (13.517 y) (continued) $\gamma(^{152}\text{Sm})$

I γ normalization: The absolute intensity of the 1408 γ has been evaluated to be 20.85% 9 (2007BeZP). Normalization of the photon intensities to I γ (344 γ in Gd)=100 gives I γ (1408 γ)=78.41 10 and Σ I(γ +ce)(to Gd g.s.)=105.02 18. From these data one gets branching (β -)=27.92 13 and thus branching (ε)=72.08 13. All unplaced γ 's from 13-y ¹⁵²Eu decay are listed in this dataset. some of these May belong in Gd following decay of the β^- branch. α (K)exp have been calculated by the evaluator from I(ce(K)) (weighted average of references given) and the adopted I γ . The I(ce(K)) have been normalized to the 344.2780 γ in ¹⁵²Gd, α (K)(344 γ ,E2)=0.03103. The experimental α ratios given are also weighted averages of the references cited. K α x ray=224 34, K β x ray=51.6 20 (relative to I(344 γ , ¹⁵²Gd)=100) (1993Ka30).

Not seen by 1992Ya12, $I_\gamma<0.005$. $\alpha=0.000989$ 14; $\alpha(\text{K})=0.000691$ 10; $\alpha(\text{L})=9.09\times 10^{-5}$ 13; $\alpha(\text{M})=1.94\times 10^{-5}$ 3; $\alpha(\text{N}+..)=0.000188$ 3 $\alpha(\text{N})=4.38\times 10^{-6}$ 7; $\alpha(\text{O})=6.57\times 10^{-7}$ 10; $\alpha(\text{P})=4.12\times 10^{-8}$ 6; $\alpha(\text{IPF})=0.000182$ 3 Mult.: $\alpha(\text{K})_{\text{exp}}=0.00072$ 5 (1967La13). $\alpha(\text{K})(\text{theory})=0.000905$ (M1), 0.000691 (E2). $\alpha(\text{K})_{\text{exp}}$ allows some M1; however, placement in the decay scheme requires $\Delta J=2$.

[†] Weighted average of values of 2007Ku20, 1990Me15, and 1990St02, except where noted otherwise. In particular, values from 2000He14 are adopted wherever available. These authors give recommended values, based on $E_\gamma=411.80205$ (17) for the ¹⁹⁸Au transition, from a reanalysis of data of 1992Le19 and 1986Wa33. transitions seen only by 2007Ku20 are noted. Based on extensive coincidence studies, these authors report several weak transitions and also resolve for the first time the 444 and 719 γ doublets. 2004Ca04 also report some of the weak transitions, and inclusion of values from these authors is noted. For the data of 1990Me15, α comparison of the values with those from other works and from energy level differences, and the observation of some internal inconsistencies, suggest that In some cases the stated uncertainties are too small. The evaluator has assigned a minimum uncertainty of 50 eV to the data from this reference.

[‡] Values are weighted averages of data of 2007Ku20, 2004Ca04, 1998Hw07, 1993Ka30, 1992Ya12, 1990Me15, 1990St02, 1989Da12, 1986Me10, 1984Iw03, 1980Sh15, 1979De21, 1977Ge12, 1975LeZH, 1972Bb05, 1971Ba63, 1970No06, 1970Ri19, and 1969Va09 normalized to $I_\gamma=100$ for the 344 γ in Gd. Some of the

values adopted here differ from those of 2004VaZW, an evaluation of data published prior to 2004. Some of these differences are a result of inclusion here of the new work, 2007Ku20, and one older reference, 1975LeZH. Another difference is one of policy. In 2004VaZW, the uncertainties in the work of 1998Hw07 were increased by a factor of two. This was not done in the present evaluation. also, In the present evaluation, for the data from 1990Me15, an uncertainty of 2% has been added In quadrature to take into account the uncertainty In the efficiency calibration. Intensities for some weak transitions have been given by 2004Ca04, and these are noted. Some additional weak transitions have been reported by 1989Gh02. These have been looked for but not confirmed by 1993Ka30, except for the the 137.56 γ from the 1372 level which has been confirmed by 2007Ku20. Transitions noted As being excluded In individual cases are outliers As determined from CHAUVENET's criterion.

From Adopted Gammas. Mult measurements from this decay are given in comments. The $\alpha(K)$ exp values are from the ce data of the references as noted, using the adopted I_γ values, normalized to $\alpha(K)=0.03103$ for the 344 E2 transition in Gd.

@ The 963 γ -964 γ doublet is placed from the 963 and 1085 levels, respectively. The doublet has been resolved by 2007Ku20, 1972Bb05, and 1971Ba63 with $I_\gamma(963\gamma)=0.528\ 23$ and $I_\gamma(964\gamma)/I_\gamma(\text{doublet})=0.9904\ 6$. The value given for $I_\gamma(964\gamma)$ is α weighted average of all values with this correction factor applied to the unresolved data. Since 99% of the intensity belongs with the 1085 level, the evaluator assumes that the measured energies can be assigned to this placement. The evaluator adopts $E_\gamma=964.057\ 5$ from 1986Wa33. From a measurement of ce energies, 1984Bu35 determine $E(964\gamma)-E_\gamma(963\gamma)=0.690\ 5$, which then gives $E_\gamma(963\gamma)=963.367\ 5$. $\alpha(K)$ exp=0.00245 6 (1990Ka35, 1985Co08, 1981Ka40, 1979De22, 1967Ma29), for the doublet, along with $\delta=-9.3\ 6$ is consistent only with mult=M1+E2 for the strong component ($\alpha(K)=0.00233\ 11$ for E2). No assignment can be made for the weak component based just on the ce data but if one assumes mult(963 γ)=E1, based on its placement, then one gets $\alpha(K)$ exp=0.00246 6 for the 964 γ , consistent with mult=E2. there seems to be No need to invoke an E0 component for the 964 γ As has been suggested by some authors.

& The 444 γ is a doublet placed from the 810 and 1530 levels. The doublet has been resolved by 2007Ku20, 1972Bb05, 1971Ba63, 1970Ri19, and 1969Va09 with $I_\gamma(\text{from } 810)=1.12\ 4$ and $I_\gamma(\text{from } 1530)/I_\gamma(\text{doublet})=0.906\ 4$. The value adopted for the 1530 level is a weighted average of all data with this correction factor applied to the unresolved data. The value of 1970No06 has been excluded. Since 91% of the intensity belongs with the 1530 level, the evaluator assumes that the measured energies can be assigned to this placement. The evaluator adopts E_γ from 1992Le19. The value given for the 810 level is from 2007Ku20. from $\alpha(K)$ exp=0.00596 16 (1991Go22, 1985Co08, 1979De22) for the doublet, with $\alpha(K)(\text{theory})=0.00485$ (E1) and 0.0144 (E2), the strong component must be E1 and the weak component mainly E2. placement of the weak component In the decay scheme requires $\Delta J=2$.

^a The 919 γ is placed from the 1041 and 1730 levels. The doublet has been resolved by 2007Ku20 and 2004Ca04 from which a weighted average of $I_\gamma=0.0244\ 14$ is obtained for the weak component from the 1730 level. The values for the doublet obtained by the other authors are corrected for this component and give α weighted average of 1.574 16 for the component from the 1041 level.

^b The 719 γ is placed from the 1086 and 1530 levels. 2007Ku20 resolve the components and show that 85% of the intensity belongs with the 1086 level. The evaluator assumes that the accurate E_γ value from 1992Le19 can be assigned to this placement. the doublet is not resolved in the other works. $\alpha(K)$ exp=0.0038 7 (1983KaZJ) for the doublet is consistent with mult=E2 for placement from the 1086 level and mult=E1 for placement from the 1530 level. These mults are expected based on the ADOPTED J^π values.

^c From 2000He14.

^d This unplaced transition is from 1993Ka30.

^e This unplaced transition is from 1990Me15.

^f Weighted average from 1992Le19 and 1986Wa33. Not included in 2000He14.

^g The 285 γ is doubly placed, from the 1372 and 1579 levels. E_γ and I_γ for placement from the 1372 level are from 2007Ku20 and for the 1579 level are weighted averages from 2007Ku20 and 2004Ca04. The transitions are not resolved in other works.

^h From 1986Wa33.

ⁱ Weighted average from 2007Ku20 and 2004Ca04.

^j Weighted average from 2007Ku20, 2004Ca04, and 1990Me15.

¹⁵²Eu ε decay (13.517 y) (continued)

$\gamma(^{152}\text{Sm})$ (continued)

^k The 674 γ is placed from the 1041 level in Sm and from the 1606 level in Gd with $I_{\gamma}(\text{doublet})=0.706$ 14. the component in Sm is resolved by [2007Ku20](#) with $E_{\gamma}=674.64$ 14 and $I_{\gamma}=0.656$ 21. From branching in Tb ε decay, the component in Gd can be deduced as 0.080 3 which, combined with I_{γ} for the doublet, gives $I_{\gamma}=0.628$ 15 for the component in Sm. The value adopted is a weighted average of these two determinations.

^l From [2007Ku20](#).

^m For absolute intensity per 100 decays, multiply by 0.2659 11.

ⁿ Total theoretical internal conversion coefficients, calculated using the BrIcc code ([2008Ki07](#)) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

^o Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.
