[†] [1976Bu03](#) estimate uncertainties as 4 to 5 keV, but recalibration of spectrum and using updated and more precise value of S(2n), [2005Bu02](#) obtain $\Delta E(\text{level})=2$ keV.

[‡] From L value with $J^\pi=5/2^+$ for target. See ^{153}Eu Adopted Levels for band structure.

[#] Values are for L=0 states expressed as percentage of the total L=0 strength.

[@] Angular distributions are in reasonably good agreement with DWBA predictions for L=2, but [1976Bu03](#) indicated that, since multistep processes are likely involved in the reaction mechanism, they have not calculated spectroscopic factors.
