

$^{154}\text{Sm}(\text{d},\text{3n}\gamma)$ 1975Dr07,1980Be61

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	N. Nica	NDS 170, 1 (2020)	16-Aug-2020

1975Dr01: E=18-25 MeV; measured $E\gamma$, $I\gamma$ $\gamma\gamma$ coincidences, and $\gamma(\theta)$.

1980Be61: E=13.5 MeV; measured $E\gamma$, $I\gamma$.

 ^{153}Eu Levels

Levels are reported in both 1975Dr07 and 1980Be61, unless otherwise noted.

^b Band(C): 3/2[411] band.

 $\gamma(^{153}\text{Eu})$

Many of the $\gamma(\theta)$ results given by 1975Dr01 are for γ peaks including two or more γ 's. These data are not given here, but they exist for the following γ combinations: 108.5 + 109.7 + 111.6, 126.7 + 128.8 + 129.5 + 131.6, 151.6 + 151.9, 241.3 + 242.6, 267.7 + 268.2, and 365.3 + 367.

[†] Values with uncertainties are from 1980Be61 and others are from 1975Dr07. Many lines in 1980Be61 are noted as containing contributions from other reactions.

[‡] From 1975Dr07 for $E(\text{d}) = 22$ MeV; other: 1980Be61. Often the values from the two papers are quite different, probably due contributions from other reactions. Significant differences in branching from a level are noted.

[#] The intensities of γ rays from peaks that are multiple are based on the branching ratios in the ^{153}Eu Adopted data.

[@] E2 assignments are made by evaluator based on authors' statement that :large positive A_2 and negative A_4 are characteristic of stretched quadrupole transitions" and the fact that M2 transitions are not expected.

[&] From 1975Dr07.

^a Relative branching from level (1980Be61).

^b Includes contribution from another reaction (1980Be61).

^c Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.
