

**$^{153}\text{Dy}$   $\varepsilon$  decay    1980Ab19, 1980Ab21**

| Type            | Author  | History<br>Citation | Literature Cutoff Date |
|-----------------|---------|---------------------|------------------------|
| Full Evaluation | N. Nica | NDS 170, 1 (2020)   | 16-Aug-2020            |

Parent:  $^{153}\text{Dy}$ : E=0.0;  $J^\pi=7/2^{(-)}$ ;  $T_{1/2}=6.4$  h *I*;  $Q(\varepsilon)=2170.4$  19; % $\varepsilon$ +% $\beta^+$  decay=100.0

Sources produced in 660-MeV proton spallation of Ta target followed by chemical and mass separations ([1980Ab19](#), [1978Gr13](#), [1977Al29](#), and [1977Al28](#)),  $^{154}\text{Gd}(^3\text{He},4\text{n})$  with chemical separation ([1977De05](#)), and  $^{155}\text{Gd}(\alpha,6\text{n})$  with chemical separation ([1972Ha41](#)). Measured  $E\gamma$ ,  $I\gamma$ , Ice, and  $\gamma\gamma$ ,  $\gamma$ -ce, and  $\gamma\beta^+$  coincidences.

The decay scheme is from [1980Ab19](#) and is based on earlier work by [1978Gr13](#), [1977De05](#) and [1972Ha41](#). Other measurements: [1977Al29](#), [1977Al28](#), [1975ZuZZ](#).

<sup>†</sup> Measured values of  $E\beta+$  include 1069 keV 10, 886 keV 2 and 427 keV 22 by 1978Gr13; 980 keV 40 and 670 keV 20 by 1977De05. 1978Gr13 suggest that their observed branches populate levels at 80.8 keV ( $7/2^+$ ), 262.9 keV ( $9/2^-$ ) and 725.6 keV ( $9/2^-$ ) or 740.7 keV ( $7/2^+$ ), respectively, but they must each represent branches to several levels.

<sup>‡</sup> See 1978Gr13 for measured  $I(\beta+)/I_K(254 \gamma)$  ratios. They decompose the  $\beta^+$  spectrum into three components, but each of their components must represent several branches.

<sup>#</sup> From intensity balances at the excited levels and an assumed  $I_{(\varepsilon+\beta^+)}(0)=1.4\%$  13. The large number of unplaced  $\gamma$ 's has not been taken into account, but they would move some of the  $\varepsilon$  intensity to higher levels and thereby reduce the average  $\beta^+$  energy per decay.

<sup>@</sup> Absolute intensity per 100 decays.

<sup>153</sup>Dy  $\varepsilon$  decay    1980Ab19,1980Ab21 (continued)

 $\gamma(^{153}\text{Tb})$ 

I $\gamma$  normalization: From  $\Sigma I(\gamma+ce)$  to gs=100. From  $\beta+$  spectra of 1978Gr13,  $I\beta+(gs)<0.2\%$  (1980Ab21) yielding  $I(\varepsilon+\beta+)(gs)<4\%$ . Also, from  $I(\beta+)/I_K(254 \gamma)$  data of 1978Gr13, one gets  $I(\beta+)(262 \text{ level})=0.56\%~4$  compared with  $0.591\%~12$  deduced from the decay scheme using the adopted normalization. Note, however, that absolute I $\gamma$  measurements of 1970Ch09 give an average normalization factor of 0.085 5, which leads to  $I(\varepsilon+\beta+)/I_K(254 \gamma)=25\%~5$ .

There are many differences between the E $\gamma$  and I $\gamma$  values of 1980Ab19, 1977De05, and 1975ZuZZ (and partially repeated in 1977Al28). Some of these differences are noted in comments associated with specific  $\gamma$ 's, but there are also many cases where a  $\gamma$  is reported in only one paper or is reported as a singlet in one paper and as a doublet in another paper.

<sup>†</sup> From 1980Ab19, unless noted otherwise; other: 1977De05. A comparison of the  $E_\gamma$  with the level energy differences indicates that the  $E_\gamma$  uncertainties are somewhat underestimated; for example, from about 280 such comparisons one expects about 14 to be outside of  $2\sigma$ , but 26 are outside this value.

<sup>‡</sup> From 1980Ab19, unless noted otherwise. Where the value of 1977De05 or 1975ZuZZ differs significantly, this is noted; these sets of  $I_\gamma$  were normalized at the 80.7  $\gamma$  for  $\gamma$ 's below 150 keV and separately at the 254.2  $\gamma$  for  $\gamma$ 's above 150 keV.

<sup>#</sup> Listed values are those given by 1980Ab19 and were deduced from measured  $c_{eK}$  and  $I_\gamma$ .

<sup>@</sup> From 1977Al28.

$^{153}\text{Dy } \varepsilon \text{ decay} \quad \textbf{1980Ab19,1980Ab21 (continued)}$

$\gamma(^{153}\text{Tb})$  (continued)

<sup>a</sup> Additional information 1.

<sup>a</sup> Additional information 2.

<sup>b</sup> For absolute intensity per 100 decays, multiply by 0.1122 24.

<sup>c</sup> Multiply placed with undivided intensity.

<sup>d</sup> Multiply placed with intensity suitably divided.

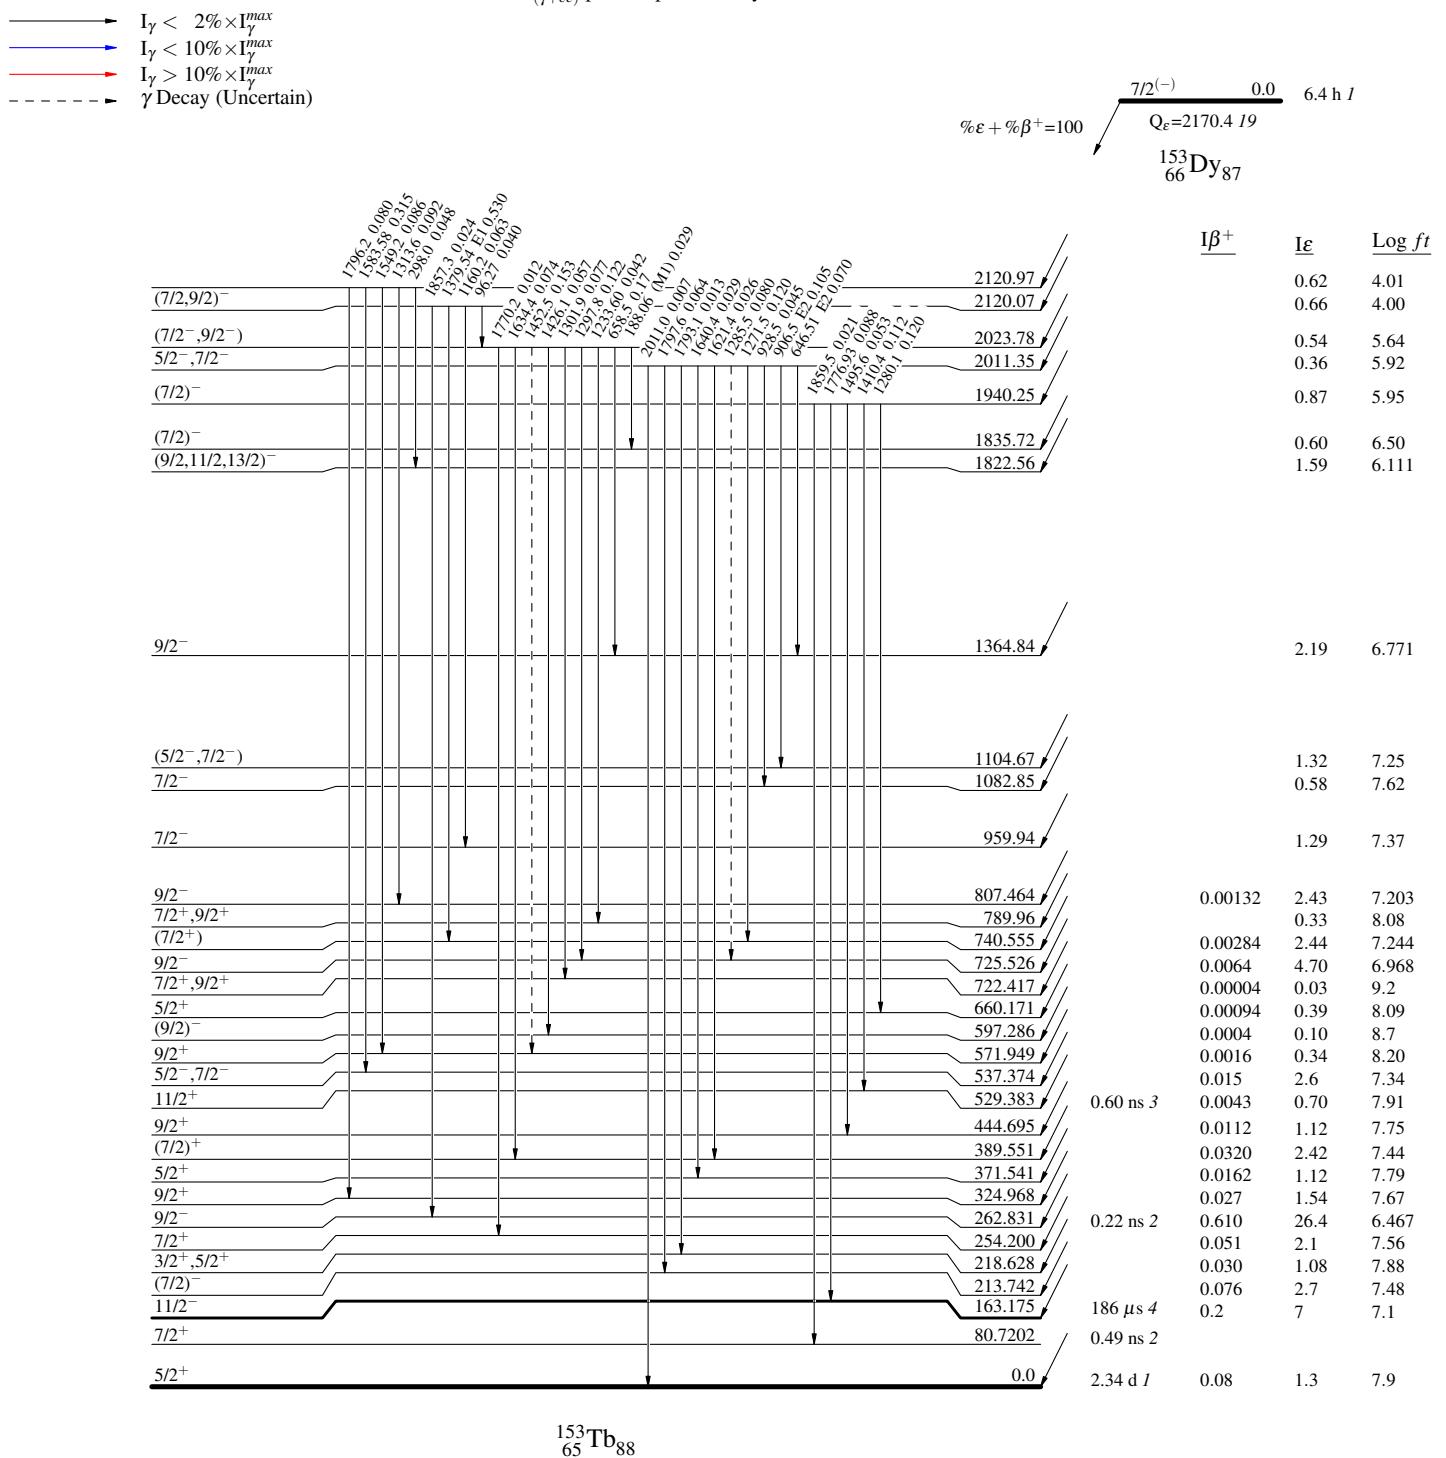

<sup>e</sup> Placement of transition in the level scheme is uncertain.

<sup>x</sup>  $\gamma$  ray not placed in level scheme.

## Decay Scheme (continued)

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays

$^{153}\text{Dy}$   $\varepsilon$  decay    1980Ab19,1980Ab21

## Decay Scheme (continued)

## Legend

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays  
& Multiply placed: undivided intensity given

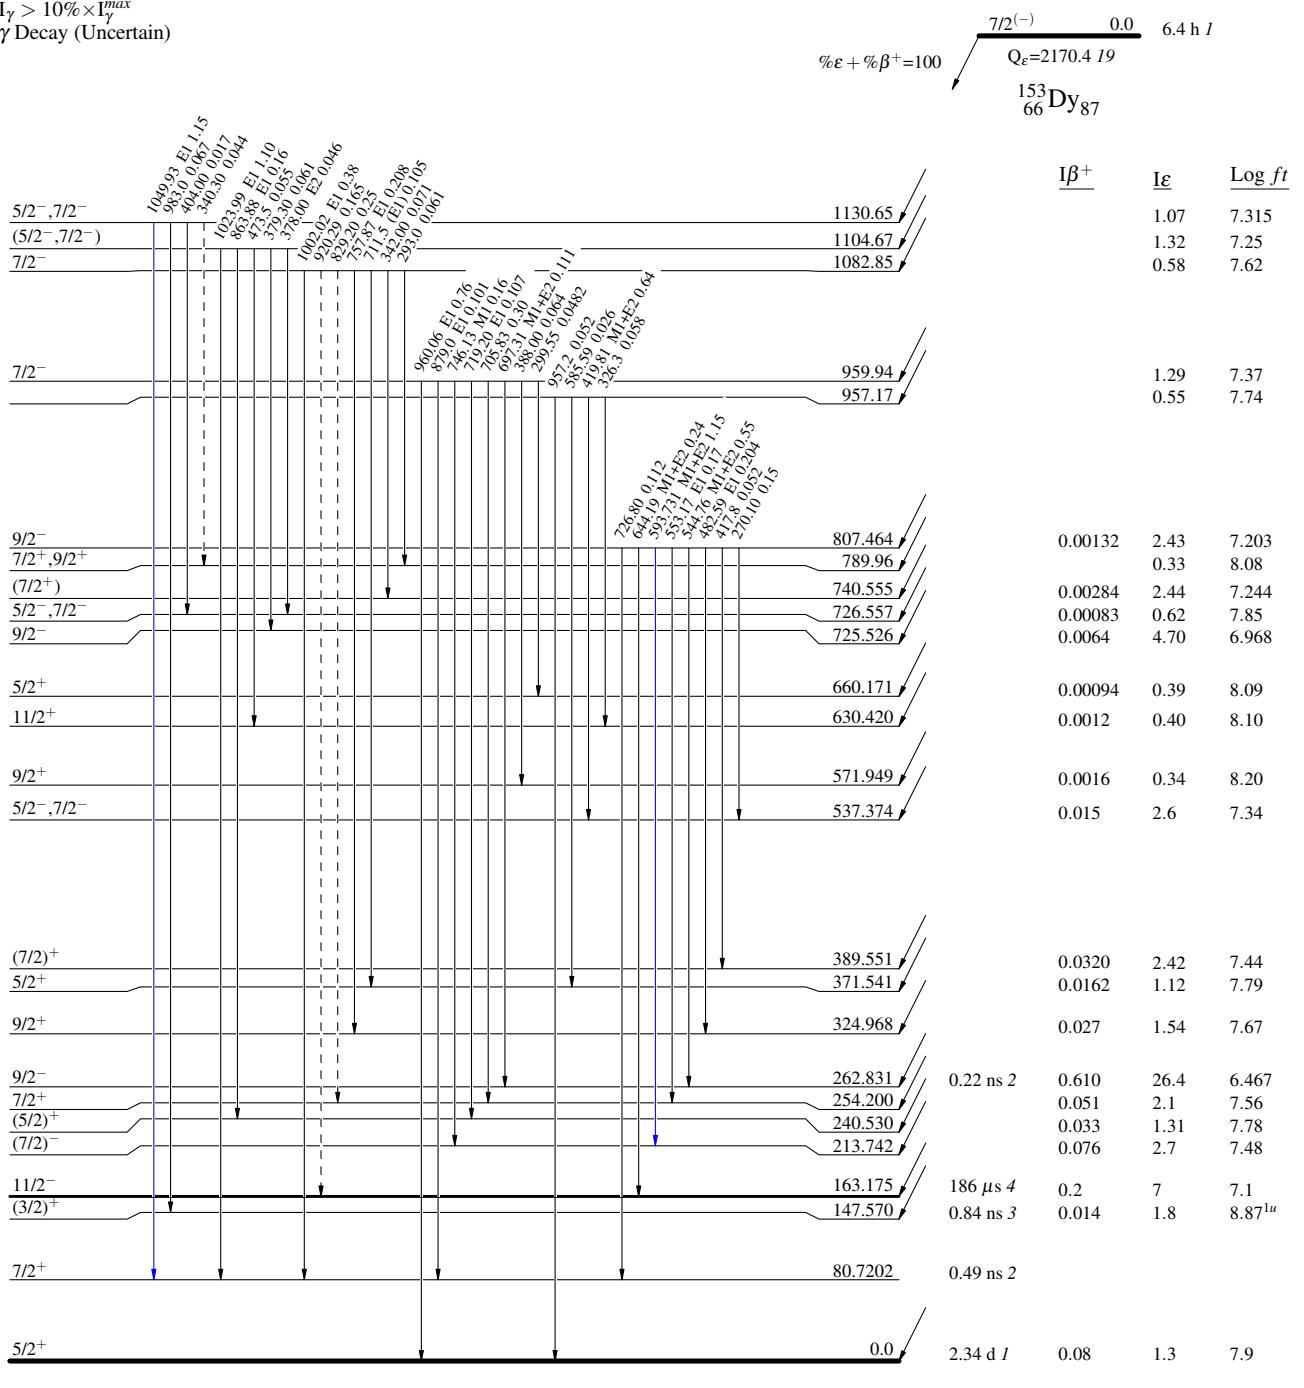

$^{153}\text{Dy}$   $\varepsilon$  decay    1980Ab19,1980Ab21

## Decay Scheme (continued)

## Legend

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays  
& Multiply placed: undivided intensity given

- $I_\gamma < 2\% \times I_\gamma^{\max}$
- $I_\gamma < 10\% \times I_\gamma^{\max}$
- $I_\gamma > 10\% \times I_\gamma^{\max}$
- - -  $\gamma$  Decay (Uncertain)

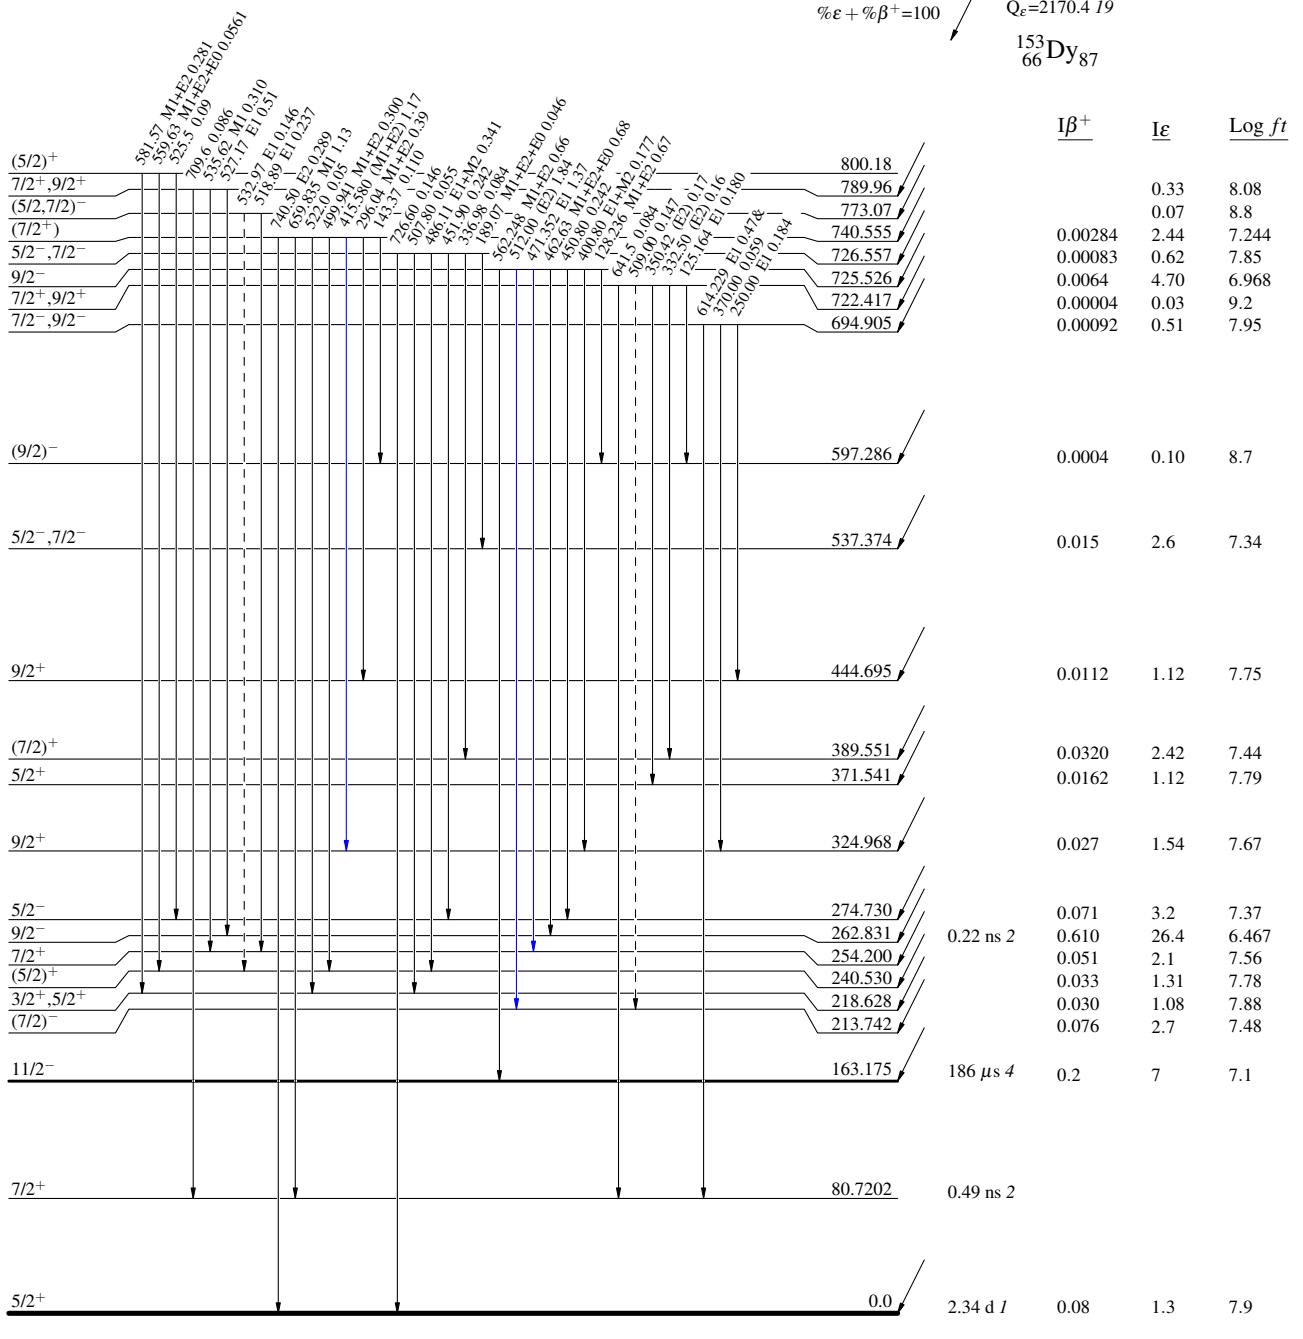

$^{153}\text{Dy}$   $\varepsilon$  decay    1980Ab19,1980Ab21

## Decay Scheme (continued)

## Legend

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays  
& Multiply placed: undivided intensity given

- $I_\gamma < 2\% \times I_\gamma^{max}$
- $I_\gamma < 10\% \times I_\gamma^{max}$
- $I_\gamma > 10\% \times I_\gamma^{max}$
- - -  $\gamma$  Decay (Uncertain)

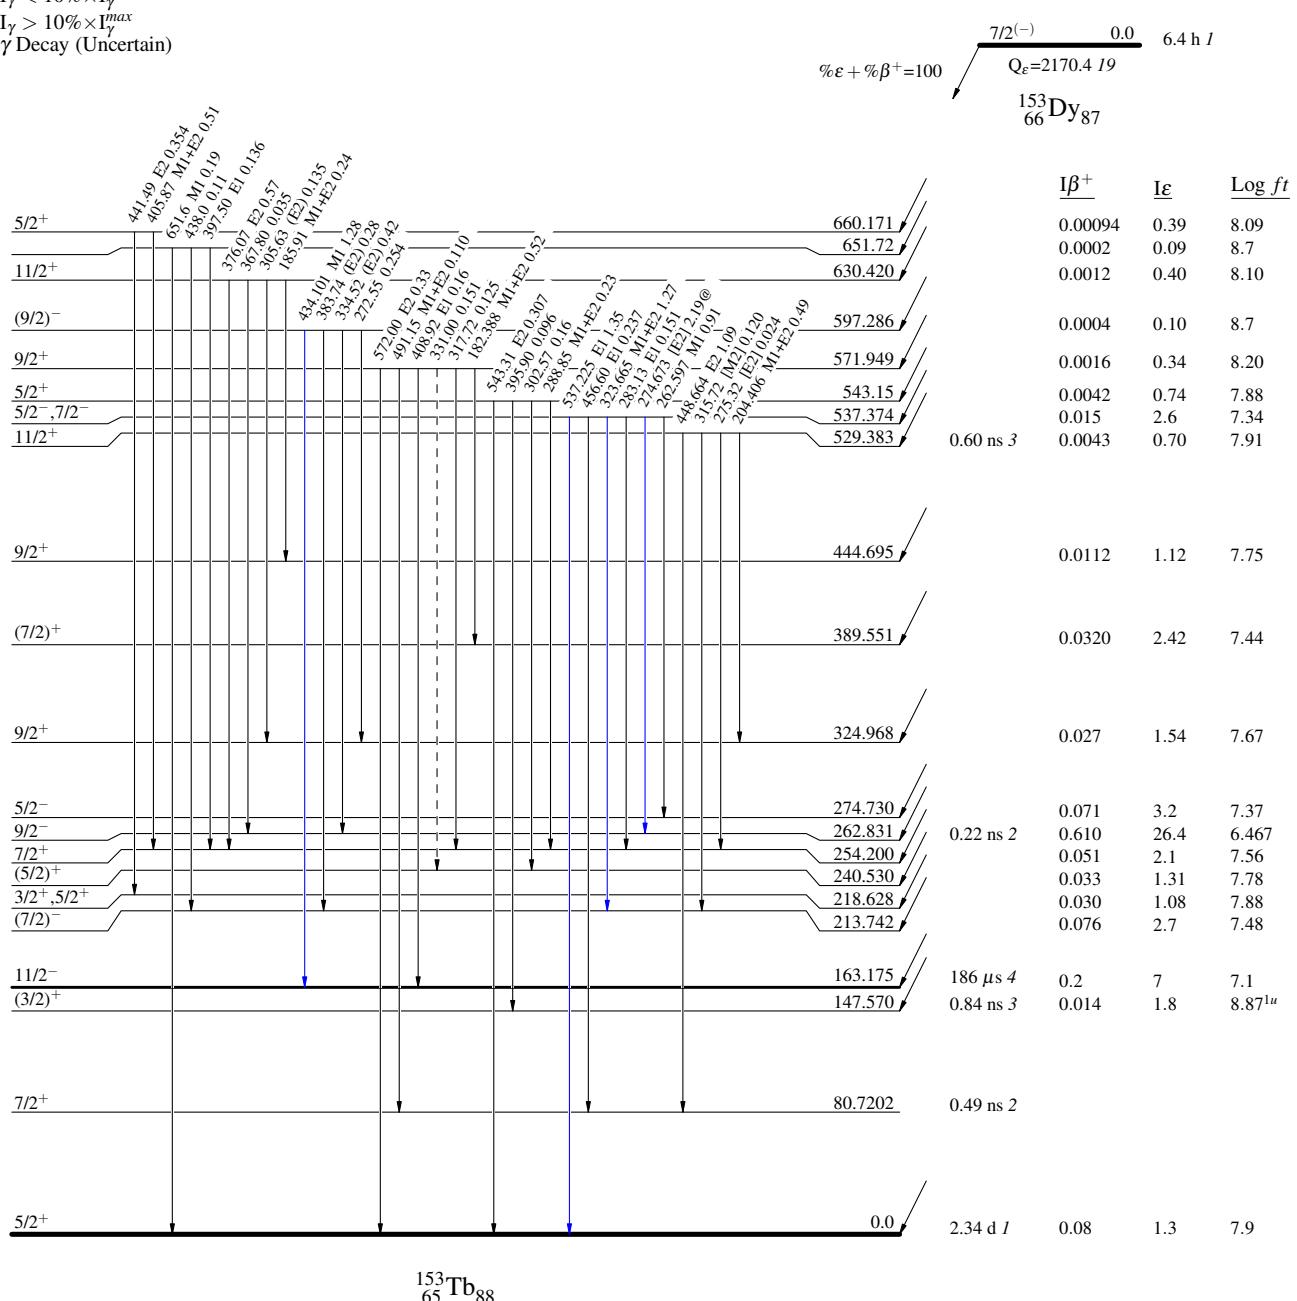

$^{153}\text{Dy } \epsilon$  decay    1980Ab19,1980Ab21

## Decay Scheme (continued)

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays& Multiply placed: undivided intensity given  
@ Multiply placed: intensity suitably divided

## Legend

- $I_\gamma < 2\% \times I_\gamma^{\max}$
- $I_\gamma < 10\% \times I_\gamma^{\max}$
- $I_\gamma > 10\% \times I_\gamma^{\max}$
- $\gamma$  Decay (Uncertain)

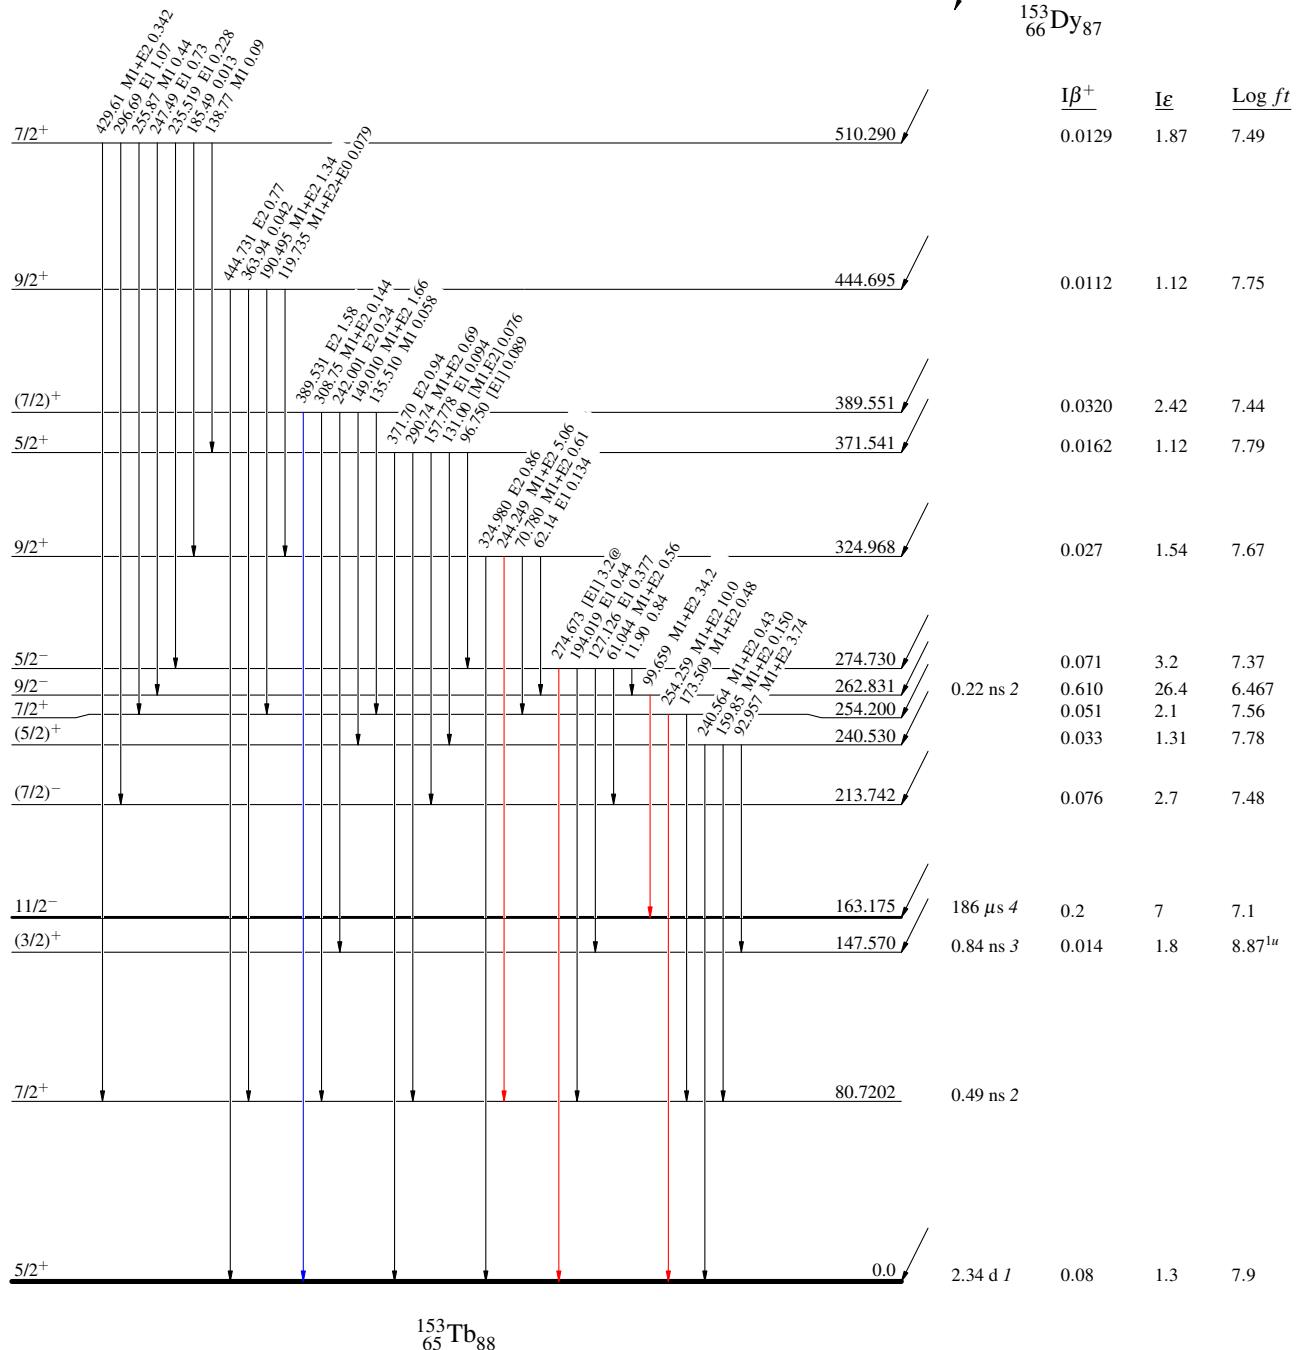

$^{153}\text{Dy } \varepsilon \text{ decay} \quad 1980\text{Ab19,1980Ab21}$ 

## Decay Scheme (continued)

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays  
 & Multiply placed: undivided intensity given  
 @ Multiply placed: intensity suitably divided

## Legend

- $I_\gamma < 2\% \times I_\gamma^{\max}$
- $I_\gamma < 10\% \times I_\gamma^{\max}$
- $I_\gamma > 10\% \times I_\gamma^{\max}$

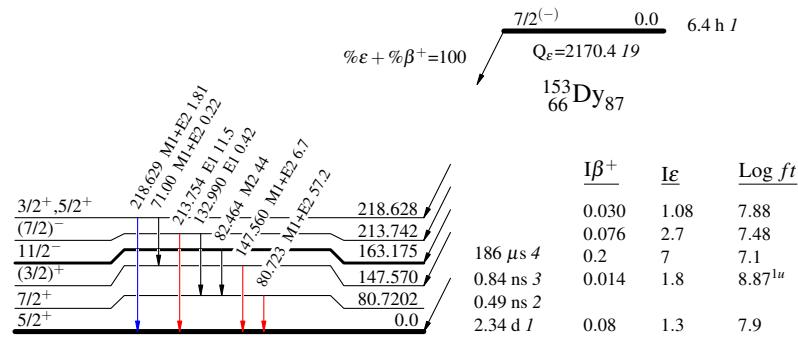

$^{153}\text{Dy } \varepsilon \text{ decay} \quad 1980\text{Ab19,1980Ab21}$ 

## Decay Scheme (continued)

Intensities:  $I_{(\gamma+ce)}$  per 100 parent decays  
 & Multiply placed: undivided intensity given  
 @ Multiply placed: intensity suitably divided

## Legend
