

$^{156}\text{Gd}(n,n'\gamma)$  1996Ko41,1983BeZC

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	C. W. Reich	NDS 113, 2537 (2012)	1-Mar-2012

## Additional information 1.

**1983BeZC**: enriched (96.5%  $^{156}\text{Gd}$ )  $\text{Gd}_2\text{O}_3$  target of mass 17 g. target irradiated by fast-reactor neutrons. Measured  $\gamma$ 's from 60 keV to 3 MeV. Observed 290 transitions, 80 of which are new. Authors list  $E_\gamma$  and  $I_\gamma$  for only the 39 strongest of these. They state that they observe 60 levels up to an energy of 2838.7 keV. Energies and  $J^\pi$  values are quoted for 17 of these. No level scheme is given.

**1996Ko41**: carried out Hauser-Feshbach-Moldauer statistical-model calculations of the population of the excited states of several nuclides. These authors compare their results with the data of **1983BeZC** and thus provide some insight into these data. results presented for  $^{156}\text{Gd}$ ,  $^{158}\text{Gd}$  as well as for  $^{152}\text{Sm}$  and  $^{154}\text{Sm}$ .

Similar information is contained in **1995KoZQ**.

**1983BeZC** do not show their level scheme and the associated  $\gamma$ -ray transitions. The level scheme shown here May not be complete. it is based largely on that shown in **1996Ko41**, which was given to compare experiment with their calculations. Also included are those levels specifically mentioned by **1983BeZC**.
